December 2013

P R E F A C E

Assessment of agricultural production in Nigeria is an activity of NAERLS that contributes to Institute Mandate (IM) Nos. 2, 3 and 4. The assessment exercise was conducted in August/September 2013 in conjunction with: Federal Department of Agricultural Extension (FDAE), Planning Research and Statistics Department (PRSD), National Bureau of Statistics (NBS), Federal Department of Fisheries (FDF), Nigeria Meteorological Agency (NIMET), Federal Department of Agriculture (FDA), Federal Department of Livestock (FDL), National Productivity Centre (NPC) and the six Zonal Coordinating Research Institutes. We are pleased to report this year that the National Institute for Oil-Palm Research (NIFOR) that is coordinating Research-Extension-Farmer-Input-Linkage (REFILs) activities in the South-South agro-ecological zone was able to participate in the exercise. Twenty teams of three specialists each covered all the 36 states of Nigeria and the Federal Capital Territory (FCT), involving 148 LGAs across the country. The headquarters and the newly established Green House Offices of the Federal Ministry of Agriculture and Rural Development (FMARD) were also covered. We wish to particularly commend the teams that were assigned to cover Borno, Yobe, Nassarawa and Plateau states, in which civil unrest prevailed, for their sacrifices while praying for speedy return of peace to these states.

The same sincere gratitude goes to officials of the Ministries of Agriculture, State Agricultural Development Projects (ADPs), other State parastatals and LGA officials across the country that made all the necessary arrangements to facilitate the smooth conduct of the field work and also provided the required data. The outputs of the evaluation exercise have been put together into an executive summary (national), states and national reports, which are circulated to all states and relevant Federal agencies and other stakeholders. This National Report is the last in the series of reports of the assessment of the 2013 wet season, providing overall trends and findings that can guide decision-makers and researchers. The Report also highlights the progress being made under the Agricultural Transformation Agenda (ATA). The unrelenting efforts and participation of agencies such as NBS, NPC, NARIs and NIMET continue to raise the scope and quality of the reports. Concerted efforts are being made to improve the capacity of all participating agencies in data collection and management. Comments on this National Report are welcome.

EXECUTIVE SUMMARY

The Wet Season Agricultural Performance Survey (APS) for the year was conducted between 26th August and 3rd of September 2013. The survey was carried out by the National Agricultural Extension and Research Liaison Services (NAERLS) in collaboration with the Federal Department of Agricultural Extension (FDAE) and several other stakeholders in agricultural data generation and use. The agencies/departments that participated include the Planning Research and Statistics Department (PRSD), National Bureau of Statistics (NBS), Federal Department of Agriculture (FDA), Federal Department of Fisheries (FDF), Federal Department of Livestock (FDL) Nigerian Meteorological Agency (NIMET), National Productivity Center (NPC) and the six Zonal Coordinating Research Institutes; Institute for Agricultural Research (IAR), Lake Chad Research Institute (LCRI), National Cereals Research institute (NCRI), Institute of Agricultural Research and Training (IAR & T), National Root Crops Research Institute (NRCRI) and National Institute For Oil-palm Research (NIFOR). A broad scope of participation has been maintained to sustain improvement in the quality, utility and depth of data generated from the survey.

The objectives of the survey were to: assess the agricultural performance during the wet season; make production forecasts; identify constraints to increased agricultural productivity and effective extension delivery service; and provide feedbacks for improved research and policy performance.

Twenty multi-disciplinary teams of three scientists each were constituted, making a total of 60 scientists, to carry out the exercise across the country using Participatory Rural Appraisal (PRA) techniques. This involved the use of structured questionnaire/ checklists, farm visits/observations, interviews with farmers and Ministry/ADP officials. In every state, two communities were selected from two LGAs in each of two selected agricultural zones for evaluation. From each community, five farmers were interviewed in addition to focused group discussions held at every site. Final wrap-up sessions to validate data generated were held at the end of each state visit with officials of the state ADPs and Ministries of Agriculture. Also, all the Green House Directors/offices were consulted and encouraged to complete the questionnaire on ATA activities in their respective states.

In the current report, the land area estimates made in 2012 are the base figures used in computing percentage changes in the areas devoted to various crops in 2013, while discounted output figures that provide for losses or damages caused by the massive floods that occurred in 2012 were used in computing the percentage changes in outputs between the two years under reference. The summary of the findings of the survey are presented below.

The objectives of the survey were to: assess the agricultural performance during the wet season;

- Make production forecasts;
- Identify constraints to increased agricultural productivity and effective extension delivery service; and
- Provide feedbacks for improved research and policy performance.

Rainfall Situation

The rainfall pattern in 2013 was generally similar to that of 2012. The rains however started much earlier in several states in 2013 between April and May in the North East and North West zones. The rains started much earlier in Kaduna and Gombe States in February, compared with other states within their respective zones. Most of the states in the South West, South East and South-South Zones had their first rains in January. There were variations in the commencement of rain in the North Central Zone. Kogi, Nasarawa and Benue States recorded their first rains in January, Kwara in February, Plateau, FCT and Niger States in March, and Taraba in April. Heavy downpours occurred across the country but in different months, resulting in acute floods in Jigawa, Katsina, Zamfara, Sokoto, Gombe, Kebbi, Imo, Akwa- Ibom, Bayelsa, Ogun, and Oyo States, causing damages to some crops. Despite the heavy rains, dry spells were experienced in Kwara, Zamfara, Kaduna, Kebbi, Niger, Plateau, Ekiti, Gombe and FCT. Unlike in August and September of 2012 when twenty states of the country experienced unprecedented flooding, the 2013 season recorded fewer incidences of flooding in Lagos, Sokoto, Jigawa, Delta and Kano. Rainfall distribution this year was generally good across the country.

The total number of rainy days in the NCZ was higher in 2012 than in 2013, with the exception of Plateau State. The highest number of rainy days was 72, recorded in Kogi, while the lowest was 35, recorded in Kwara. The highest number of rainy days of 15 was recorded in the month of August in Plateau state. Again, the number of rainy days in each station across the SWZ was more in 2012, compared to 2013. Ondo and Oyo recorded 85 and 62 rainy days in 2012 compared to 51 and 47 in 2013 respectively.

Also, in the SEZ, the number of rainy days in 2013 showed a general decrease across the zone over those of 2012. Abia and Enugu States recorded 78 and 47 rainy days in 2013, compared to 98 and 71 days respectively in 2012.

Agricultural Mechanization

Agricultural mechanization is vital to averting drudgery and the attendant negative effects, such as low work output rates, poor finishing, and food inadequacy for the populace. It is quite obvious that majority of Nigerian farmers are not into mechanized farming. Available data showed that the total number of Government-owned functional tractors increased slightly by 27.9% from 1,072 in 2012 to 1,372 in 2013. Federal Government awarded between 25% and 45% subsidies on tractors sold to farmers, depending of the model and length of period it was kept in storage. Also, Federal Government donated 2 tractors to first generation universities and 1 for each faculty of Agriculture to facilitate practical skills acquisition by students. Provision of tractors was also encouraged by a number of states. In Kaduna State, for example, 132 tractors were sold to farmers' cooperatives on cash and carry basis at 60% subsidy.

Non-functional government tractors across the states were 738 and 822 in 2012 and 2013 respectively, which shows an increase of 11.4%. Available data also showed that privately owned functional tractors were 1,038 and 408, for 2012 and 2013 respectively, representing a rapid decrease of 154% within a year. The number of non-functional tractors increased slightly from 343 in 2012 to 441 in 2013. The North West had the largest number of tractors in all the zones, with 629 and 617 in 2012 and 2013 respectively, followed by South West, with 141 and 462 in 2012 and 2013. The level of increase in the number of tractors was highest in the South West and least in the North East.

New tractors at one of the LGAs in Oyo state awaiting distribution in 2013

In many zones, especially in the North East, South East and South-South Zones, the number of tractors decreased remarkably. For 2012 and 2013 respectively, North East had 124 and 107; South East, 149 and 59; and South-South, 61 and 55. The North Central had the least number of tractors in 2013. Katsina State had the highest number of Government owned tractors, with 538, followed by Benue State with 148.

A typical situation in many tractor hiring service outfits across Nigeria

Adamawa led the states with 290 functional tractors that are owned by private individuals/organization in 2013, followed by Kaduna with 174, while FCT had the least of 15 in both 2012 and 2013. The total number of functional tractors owned by both Government and private/organizations, as obtained from the state ministries of agriculture in the entire country was 2,110 and 1,780 in 2012 and 2013 respectively, representing a decrease of 15.6%.

Work bulls still remained the preferred animal power used in 2013. Number of farm animals used in Adamawa State in 2012 and 2013 were 1,500 and 1,800 respectively, which represented an increase of 16.7%. Kebbi State also had an increase of 99.2% in number of farm-power animals used between 2012 and 2013. Gombe State reported an increase, from 550 in 2012 to 670 in 2013. The data on tractor availability indicates an unhealthy national inadequacy, bearing in mind the huge arable land area to be served by these tractors. The fact that youths are abandoning agriculture owing to its drudgery under traditional practice in which cut and hoe dominate warrants a critical review of the mechanism for promoting agricultural mechanization. As the results of this survey show, Nigeria is under-tractorized; a situation which can impede the pace of transformation of agriculture.

Fertilizer Procurement and Distribution under the GES

The E-Wallet method of input supply under the Growth Enhancement Support Scheme (GES) of the Agricultural Transformation Agenda (ATA) has recorded huge improvement in the level of success and impact in 2013, compared with 2012. Available data showed that 65-70% of registered farmers across the nation were able to accessed fertilizers and seeds from the scheme. A total of 10,681,061 bags of assorted fertilizers (mainly NPK and Urea) were received and distributed to farmers across the nation. In most states, NPK and Urea were available, while only 28% of the states supplied SSP fertilizers to farmers. A few states also procured and distributed micronutrient fertilizers, such as agrolzyzer. In many states, especially in the south and in the North Central, fertilizers were supply in good time. In some state in the North West (such as Kebbi and Sokoto) fertilizer supply was largely reported to be late. In the states where fertilizers arrived late, some of the farmers re-sold their fertilizers after redemption.

The GES scheme, however, need to address some problems that were experienced in the 2013 cropping season. For instance, some farmers complained that it was difficult for them to trace their names on the list of beneficiaries even after they had received SMS messages on their phones. The problem was more sever in Bayelsa State, where some beneficiaries had to take several trips to redemption centers but could not access the inputs because these had been transferred to different redemption centers. Also, some farmers complained of situations when they mistakenly deleted SMS messages in the process of securing an interpreter for the messages sent to them. There were also reported cases of lost or stolen handsets after receiving fertilizer/seed input SMS messages. This calls for more and proper coaching of registered farmers on the E-wallet technique for enhanced results. Farmers also indicated that they will appreciate it if all

inputs under the GES will be distributed and made available early enough, suggesting between February and March of each year. Awareness level for GES increased remarkably by 42% across the country, suggesting the need for increased sensitization and promotion activities.

The strategy of targeting commodities that are imported, of which local production capacity is huge, in order to conserve foreign exchange should be extended to other inputs such as agrochemicals. Figure 1 shows the trend in pesticide imports, which continues to grow despite huge potential for local manufacture and associated employment generation potential. Weed/pests control remains one of the greatest challenges in crop production that is largely conducted manually. The fact that the youths are losing interest in agriculture due to its drudgery makes pesticide use attractive. The trend in import of pesticides therefore is likely to continue to grow and the nation stands

to benefit enormously if special incentives could be device to boost local manufacture of pesticides.

Improved Seeds, Seedlings and Stem Cuttings under the E-Wallet Initiative

The survey found that 22,261.95MT of seeds, 64,000.0 seedlings of cocoa and 118,639 bundles of cassava stem cuttings were received and distributed to states. The different types of planting materials distributed to farmers included: 18,366.23MT Sorghum, 76,210.0MT rice, 11,006.82MT maize, 2056.92 soybean, and 125MT cotton. Seeds were supplied late in some states, while in others the supply was early. Thus the quantity of improved seeds made available to farmers increased phenomenally in 2013, relative to earlier years. Farmers' access to improved seeds increased by 23% in 2013. The use of improved rice seeds increased by 47.4%, while that of maize increased by 26.5% and sorghum by 13.5%.

Data on input provision by the other value chains of target under ATA were not available. Perhaps owing to the upsurge in the use of improved seeds and in a bid to ensure adequate supply of good quality improved seeds, the National Agricultural Seed Council initiated a broad range of incentives to facilitate rapid development of seed companies, including capacity building and linkage to credit sources (NISRAL fund). The result is an increased number of registered seed companied from about 35 in 2012 to over 75 in 2013. Many of the seed companies interviewed, however, complained that the tenure of NISRAL-linked credit was too short (limited to 6 months) and that the interest drawback incentive (component) guaranteed by government was being unduly delayed, thus, negatively impacting on their cash flow.

Despite the increased production, most farm ops are manually conducted

Food Commodity Prices

The prices of most of the food grains, such as maize, millet and rice increased and hit levels that were not previously encountered. Increase in maize price was highest in Taraba (138%) and Imo (117.4%) states. High changes in millet prices were reported from Nassarawa (60.45%), Benue (46.5%) and Katsina (43.4%). Kwara state reported a 36% increase in the price of rice, followed by Katsina and the FCT, with 25% each. The least changes in maize, millet and rice prices were recorded in Kaduna (13.63%), Jigawa (8.9%) and Jigawa (-0.14%) respectively.

Increases were reported in the prices of sorghum, cowpea and benniseed. The highest prices for sorghum and cowpea of 80% and 100% respectively were recorded in Gombe State. Katsina State reported a 100% increase in benniseed price. Generally, most states reported price increase of less than 20% for soybean, with exceptions in Adamawa (185%), Ebonyi (57.14%) and Enugu (45.8%). High increases in cassava tuber prices were reported in Kaduna (522.9%), Nassarawa (481.0%), Niger (411.9%) and Oyo

(127%). Gari prices were highest in Edo (550%) and Kogi (92.41%). Kaduna State reported a significant reduction of 123% in gari price. Akwa-Ibom State reported an increase of 173% in the price of cassava flour.

Significant increases in yam tuber prices were reported in Akwa-Ibom (90.2%), Kaduna (89.3%) and Nassarawa (76.3%). Osun and Ebonyi reported significant decreases, 68.7% and 61.1% respectively, in yam tuber prices. Not much data was collected on yam flour prices; however, Plateau reported a 55% reduction in yam flour price. Taraba reported a 250% increase in sweet potato price, while Katsina recorded 38%. Moderate increases were recorded for prices of goat meat, beef, and mutton. Highest increases in goat meat prices were reported by Imo (64.7%), Ogun (42.9%), Kwara (37.9%) and Enugu (31.1%). Beef price increases of 48%, 42% and 30% were reported for Cross River, Nassarawa and Edo respectively. Increases in mutton prices were highest for Jigawa (47%) and Ebonyi (31.25%).

General increases in the prices of chicken and eggs were reported. Chicken price increase was highest in Ogun (109%), Nassarawa (47%) and Zamfara (44%). Lagos recorded a 27% decrease in chicken price. The highest increase in the prices of eggs was recorded for Nassarawa (47%), then Oyo (30%), and Yobe and Adamawa with 20% each. Osun recorded a 4% fall in egg prices. Fresh fish prices recorded significant increases in Enugu (70%) and Niger (40%). Edo reported a 45% reduction in the prices of fresh fish. Not much data were recorded for frozen fish prices. Highest increase in dry fish prices were recorded in Imo (85%) and Niger (65%). Adamawa reported a 26% increase, while Ebonyi had a drop of 30%.

Crop Area and Production Estimates

The land area devoted to the cultivation of most crops in 2013 generally increased over that of 2012, although some of the increases were marginal, while others were significant. The land area cultivated for sorghum, however, decreased slightly by -0.1%, from 4.891 million hectares in 2012 to 4.884 million hectares in 2013; maize area increased by 1.0%, from 5.218 to 5.564 million hectares; rice area increased by 0.94%, from 2.703 to 2.874 million hectares; millet increased by 5.0%, from 1.28 to 1.344 million hectares;

groundnut by 4.6%, from 2.351 to 2.459 million hectares, Cassava by 2.7%, from 4.029 to 4.138 million hectares; yam by 5.9%, from 4.33 to 4.584 million hectares; Cocoyam by 7.7%, from 459,798 to 495,105 hectares; Soybean by 6.6%, from 628,520 to 670,011 hectares; Cowpea by 1.2%, from 3.29 to 3.33 million hectares; Benniseed by 6.8%, from 218,685 to 233,600 hectares; and ginger by 22.7%, from 52,505 to 64,440 hectares. Apparently, the increases in cultivated areas are a response to the incentives to various commodity value chain actors under the ATA.

Output Forecast for Various Crops

The outputs for most of the crops increased. But more remarkable increases are expected for some key ATA commodities, for which elaborate growth enhancement support have been provided (Figures 2-4). Owing to the effect of the massive flooding that occurred in 2012, depression in output trend occurred in 2012 as reflected in the figures. Thus, output forecast for rice is an increase of 28.1%, from 4.385 million tons in 2012 to 5.917 million tons in 2013. Similarly, the output forecast for maize is an increase of 19.6%, from 8.595 to 10.28 million tons; sorghum by 4.8%, from 6.414 to 6.73 million tons, millet by 2.6%, from 1.28 to 1.313 million tons; Cowpea by 7.5%, from 1.89 to 2.032 million tons; Groundnut by 3.5%, from 2.975 to 3.08 million tons; and Soybean by 4.6%, from 619,606 to 648,031 tons.

Also, the forecast for cassava is an increase of 12.6% from 47.334 to 53.288 million tons; that of yam is 14.8%, from 32.854 to 37.723 million tons; Cocoyam by 2.1%, from 3.248 to 3.316 million tons; and Cotton by 6.5%, from 73,892 to 78,700 tons. Ginger output forecast is an increase of 8.7%, from 460,821 to 501,132 tons, almost by the same token as benniseed, which increased

by 5.4%, from 246,603 to 259,953 tons. While increased outputs of most crops had been derived from extension of cultivated areas in the past, those of the current season arose due to improvements in average yields per unit area. This is probably a reflection of the increased access to improved seeds and fertilizers that is being occasioned by ATA.

Crop Pests and Diseases

Available data on major incidences of diseases, pests and natural hazards on cultivated crops during 2013 cropping season showed moderate attack of stem-bore and quelea birds on maize, rice and sorghum. A light to moderate (3-8%) estimated yield loss, similar to that of 2012 wet season, was reported. Moderate striga infestation on cereal crops, mostly maize and sorghum fields, in FCT, Niger, Gombe, Katsina, Zamfara, Taraba and Kano, was reported. Cassava mosaic virus attack was also common in Adamawa, FCT,

Lagos, Katsina and Bayelsa. Increased incidence of rodents and grass-cutter attacks on cassava were reported in Imo, Ondo, Akwa-Ibom, Rivers, Kogi and Edo. The estimated cassava yield loss due to pests/diseases was less than 12% and comparable with that of 2012 report. Incidence of red monkey attack on maize, especially at Agbani zone of Enugu State, forced farmers to abandon the cultivation of maize in the area. Cocoyam wilt which remained a challenge in 2012 in Katsina, Kaduna and Anambra has extended to Enugu State in 2013. The percentage of cultivated yield loss due to pests and diseases in 2013 was generally far less than 4%, compared to 20-25% yield loss of 2012 due to flood disasters across the nation.

Strategic Grain Reserve

The purpose of national strategic grain reserves is to ensure year-round availability of food and food commodity price control and to meet the challenges of natural and civil disasters. Government, in its policy for the 2012/2013 season, was able to store at least 5% of the total food grains produced in the country and provided relief during the period of national stress, particularly the 2012 flood distress. In this case, government acts as the farmer's buyer of last resort in collaboration with states and NGOs to ensure price stabilization. Government sold at subsidized prices, ranging from 20 - 50% subsidy levels, based on prevailing market price.

One of the privately owned silos ready for the bumper harvest being expected

The lack of adequate funding to stock government silos has been identified as a major constraint. Other constraints include bureaucratic bottlenecks that delay prompt response to prices, lack of data, and communication gaps among various stakeholders. It was reported that owing to rapid rise in commodity prices, many of the agents employed to supply grains based on GMP to the SGR silos were unable to do so. It would seem the concept of integrating the guaranty minimum price (GMP) regime to backstop the programme of buyer of last resort initiative with the supply of food grains to SGR silos will continue to be laden with challenges of poor delivery. An innovative supply scheme for the SGR is therefore necessary. It was also observed that private sector's involvement in the provision of strategic grain reserves remained negligible.

Livestock Production

Livestock production in Nigeria is an integrated economic activity which contributes about 6% of the Gross Domestic Product (GDP) and about 20% of the agricultural component of GDP. The livestock subsector thus plays a major role in the socioeconomic development of the nation. In 2013, many factors were reported to limit the development of the sector. These limiting factors vary from zone to zone and species to species. They include low genetic potential of local breeds, with respect to feed conversion, reproduction; low quality of available feed ingredients, prevalence of diseases/ parasites and inadequate supply of livestock inputs, such as veterinary supplies and feed concentrates. Ambulatory services were reported to have increased in FCT, Lagos and

Kano. The estimated data on livestock population and livestock commercial farms were not reported by most states, due mainly to poor record-keeping by the agencies concerned. Livestock populations on commercial farms were reported by only 10 states. FCT reported the highest number of commercial livestock farms.

The following cattle diseases were reported prevalent in 2013 season: foot and mouth disease (FMD), affecting cattle production in Cross River and Benue. In Niger, there was prevalence of FMD, dermatophiles, trypanosomosis and helminthiasis. CBPP was reported in Enugu State, while foot rot was prevalent in Ekiti. For goats and sheep, PPR occurrences were reported in Sokoto, Kaduna, Benue, Niger, Cross River, Anambra, Imo and Enugu. Other diseases reported were helminthiasis in Kaduna and Niger, while mange was reported in Ekiti and Imo.

Shika brown: First layer breed of Chicken developed by Nigeria

With observable increased interest in commercial poultry farms in urban centres, increase in poultry diseases became an issue. The poultry diseases reported as prevalent included: Newcastle, gumboro, fowl pox, coccidiosis, lice, salmonellosis, mareks, PP and CRD. Newcastle disease was reported in Kaduna, Niger, Cross River, Enugu and Anambra, while gumboro was reported in Kaduna, Anambra and Enugu. Cross River and Enugu reported high cases of vaccine failure, which could have resulted in the outbreak of some of the diseases. Many farmers and agro-dealers interviewed reported that the increased cases of vaccine failure were related to poor handling and erratic supply of electricity. They also complained of lack of cold storage facilities for cold chain vaccine handling.

Fisheries Production

Data from five states on artisanal fisheries output in 2013 showed a decreased in fish production in Bayelsa and Niger, from 68,048MT to 36,101MT, and from 73,300 to 45,000 compared with 2012 data respectively. This included both inland and coastal artisanal fisheries. About 20 states had no data on fisheries output. However, there was increase in fish production for Ekiti, Enugu and Benue. Moreover, Niger, FCT, Kaduna, Sokoto, Bayelsa and Ekiti procured and distributed fish feeds. Fingerlings, fish meals, culture tanks, brood stock, drugs and pelleting machine were also procured by these states. But only Sokoto procured equipment for capture fisheries, such as nets, hooks and boats. Perhaps the poor return of the questionnaire sent to state ministries of agriculture and natural resources may have accounted for the paucity of data on fisheries output in many states. The fact that Fisheries Departments were under the Ministry of Water Resources in some states made it difficult to capture such data during the survey.

Aquaculture production was affected by bacterial, fungal and viral diseases. Broken skull disease was reported in Adamawa. Fungal, viral and bacterial diseases were reported in Kano, Kogi, Enugu, and Ekiti. Fish predators, such as wild ducks, kingfishers and reptiles were reported in Bayelsa and Kogi. The major challenge to fish farmers remained that of lack of technical knowhow and manpower in disease diagnosis and treatment. Poor

feeding, insufficient water supply and poor management of fish stock were other challenges they faced. The need to train fisheries technicians on fish disease prevention, diagnosis and treatment to forestall losses remains compelling. They should also be trained on how to produce their feeds using locally available but nutritionally balanced feed resources.

Agricultural Development Projects' Extension Activities

The funding situation of ADPs in 2013, as was in 2012, remained precarious in more than 90% of the states. Most of the ADPs were poorly funded by their state governments, which led to staff redundancy. In some states where parallel extension delivery agencies are established like ADIL and FSAC, ADP staff was redeployed to serve as resource persons. Only Adamawa and Ekiti (5% of the ADPs) received a fair level of funding in 2013. Critical funding problem was most noticeable in Borno, Enugu, Zamfara, Benue, Delta, Taraba, Osun, Ondo, Lagos, Anambra and Akwa-Ibom. This had negative effects on the staffing status of the ADPs. But FCT, Nasarawa, Ogun and Oyo ADPs had appreciable number of staff—the rest of the ADPs were poorly staffed. Similarly, majority of the ADPs had aged personnel, very close to retirement. In Katsina, many of the top-level staff of the Ministry of Agriculture retired in 2013. The poor funding of the ADPs constrained recruitment to replace these ageing staff. In four years' time, about 50% of its staff will retire. Unless the challenges of poor funding and ageing staff are resolved, rapid agricultural transformation will be compromised. Indeed, an urgent and innovative mechanism of funding agricultural extension services is imperative.

Similar to 2012 report, Kano State recorded the highest number of farm families of 994,656. This was followed by Niger State, with 763,000 and Borno State with 536,322. In most of the states, farm families' records remained the same as in 2012. This may be as a result of ATA programme being implemented across the country, which has encouraged many families into agricultural production. But there was a marginal difference between 2012 and 2013 in the number of Extension Agents in many states. However, there was sharp decrease in EAs number in Adamawa, Jigawa, Zamfara, FCT, Kwara and Edo. Compared to the 2012 figures, only Niger and Abia had increased number of EAs by 73 and 33 respectively. In Adamawa, the number of VEAs decreased by 137. However, Osun, Katsina and Edo had 5, 12 and 27 EAs respectively, which reflect obvious inadequacies.

Moreover, Rivers, Edo, Benue, Abia and Sokoto recorded the highest EA: farm families' ratios, with 1:9,583, 1:9,409, 1:7,407, 1:6,000, and 1:5265 respectively. Unlike in 2012 when Adamawa had the lowest EA: FFs ratio of 1:1212, Gombe had the least of 1:996 in 2013. The variation in EA: FFs ratio over the years could be due to ADP's poor funding and low staff motivation status. The recommended EA:FFs ratio for Nigeria is 1:800. It is noteworthy that the wider the ratio the poorer the effectiveness of the extension system. Extension visit to farmers is an important performance indicator of any extension organization that assesses the intensity of technology adoption by farmers. However, Kebbi, Kano, Taraba, FCT, Niger, Kwara, Ebonyi, and Delta did not perform any farmers' visit in 2013. But Zamfara, Nasarawa, Plateau and Ondo made several visits.

SMSs are the main link between research institutes and ADPs. Proven and relevant technologies from research are taught by SMSs to VEAs. Feedback to research as a way of evaluating progress is also achieved through the SMSs, especially at the Fortnightly Trainings (FNTs) and Monthly Technology Review Meetings (MTRMs). Hence, the availability of SMSs in different agricultural enterprises— crop, livestock, fisheries, agro-processing and women-in-agriculture— remains a major performance indicator in the ADP system. Akwa-Ibom and Bauchi had the highest number of 35 and 31 SMSs in the 2013 report. Adamawa, Jigawa and Kebbi had 20 SMSs each; Ekiti had 18 SMSs, while Sokoto had the least number of 5. Generally, there was a low number of SMSs across the country, which might impact negatively on the transfer of improved agricultural technologies to farmers. On the other hand, BESs are an important supervisory force in extension service delivery. The number of BESs should ideally depend on the number of VEAs. Across the country, many ADPs recorded reasonable numbers of BESs who can adequately supervise EAs. Kano and Jigawa had the highest numbers of 133 and 47 BESs, followed by Benue and Niger with 33 BESs each. However, Osun had 3 BESs, the lowest in the country.

The success in technology dissemination and adoption by farmers depends on the number and effectiveness of SPAT, MTP and OFAR techniques conducted by ADPs. There was a slight increase in the number of ADPs that conducted these activities; but the intensity of the activities decreased in 2013, compared to 2012. Also, 18, 10 and 7 ADPs established MTP, SPAT and OFAR respectively. Akwa-Ibom, Imo, Zamfara and Benue established 2548, 893, 837 SPATs respectively. Similarly, Imo, Zamfara and Benue conducted 600, 510 and 429 MTPs correspondingly, while Jigawa and Kaduna conducted 12 and 10 OFARs during the season. In the same vein, effectiveness in technology dissemination and adoption largely depends on regular training and meetings of frontline VEAs, which is usually conducted through FNTs/MTs and MTRMs. About 57% of the ADPs conducted FNTs in 2013, as against the 59% of 2012. The slight decrease in the number of FNTs could be due to financial and other logistics problems. Also, 46% of the ADPs conducted MTRMs in 2013, as against 65% in 2012. Only Nasarawa and Kwara met their MTRM and QTRM targets in 2013.

The data also showed that the number of farmers trained in 2013 remained the same with that of 2012— as 60% of ADPs did not conduct any direct training for farmers. Kaduna, Osun, Yobe and Sokoto trained more farmers (14240, 11200, 3375 and 850 respectively) in 2013 than the other states. Feedback from farmers and EAs indicated that technical messages to end-users were sustained via national/state radio and television programmes, but that on-farm demonstrations were not commonly conducted. Borno, Adamawa, Katsina, Kebbi, Kano, Kaduna, Plateau, Niger, Osun, Edo, Delta, Cross River, Akwa-Ibom, Gombe, Sokoto and Ogun did not establish FFS. On the contrary, Yobe, Kogi, Anambra, Oyo and Imo had the highest number of FFS, recording 1350, 110, 75, 45 and 44 respectively. But Rivers had 1 FFS, the lowest for the.

Agricultural Transformation Agenda (ATA)

The implementation of the Agricultural Transformation Agenda of government was monitored this year. Available field information showed that further progress has been recorded in the area of input supply, production and other levels along the value chain. Although varied challenges were reported from participating farmers in states with GES

implementation, it was only a call for additional efforts. For instance, 65%-70% of registered farmers accessed fertilizers/certified seeds, while 118,639 bundles of cassava cuttings were also distributed to farmers. A total of 6,053,211.40MT of fertilizer was procured and distributed directly to farmers at redemption centres across the nation with no middleman. Also, the National Agricultural Seed Council indicated that the use of improved seeds increased from 14% in 2012 to 23.5% in 2013 and registered seed companies increased from 30 in 2012 to 75 in 2013. These have had direct positive impacts on field crop performance, output, employment generation and income of farmers. It is estimated that 3.26 million jobs had been created by ATA along the target value chain commodities. The identified challenges of GES were:

1. Untimely supply of input
2. Inadequate resources and equipment to clear large lands for cultivation
3. Inadequate extension workers
4. Lack of direct financing of every value chain funding at the Green House level
5. Untimely commencement of GES activities
6. Inadequate sensitization and enlightenment of field actors
7. Bad GSM network connectivity, particularly in rural areas, which impaired redemption
8. Few redemption centres; hence, farmers moved long distances to redeem their inputs
9. Lack of credit facilities to support poor farmers and high cost of credit to commercial farmers
10. Lack of irrigation facilities for dry season farming or for supplementary irrigation during protracted dry spells.

Some of the suggestions for the way forward were:

1. Input supply should be timely
2. Sensitization and encouragement of youths to embrace agribusiness
3. Recruitment and training of extension staff for sustained registration of authentic farmers
4. Improved funding of state Green Houses and ADPs
5. Improved communication and linkages between the various value chain teams and Green House staff
6. More redemption centres should be created close to farmers, and more manpower to be available at the redemption centers.

Recommendations

1. Weed control remains one of the critical challenges in crop production; and it is largely conducted manually. The fact that youths are losing interest in agriculture due to its drudgery makes pesticide use attractive. The increase of pesticide import is thus likely to continue; hence, the nation stands to benefit enormously by devising policy and special financial incentives that can boost local manufacture of pesticides.
2. Government has made modest investments in the provision of tractors, but the lack of processing machines and effective tractor repair centres are constraining optimal use of tractors, value addition and expansion of production. In order to encourage youth participation in agriculture, significant investment in mechanization/processing machines, including local fabrication and repairs, as well as cottage level processing and skill development.

3. Agribusiness is knowledge-driven and skill supported, it calls for deliberate nurturing efforts to raise a new generation of successors from among currently unemployed agriculture-related fields via a special youth empowerment and engagement scheme.
4. A renewed interest in agriculture is being stimulated by ATA, leading to increases in output; yet output markets for agricultural commodities remain uncertain because of quality, grading, weight and measure issues. In order to consolidate on the gains of ATA and sustain the trend, it is imperative that private sector-led grains (agricultural commodity) markets are developed and supported with grassroots orientation/training programmes to accelerate adoption of weights and measures and compliance with quality/biosafety standards.
5. Across the country, the earmarked silos for strategic grain reserves were largely empty because of poor contract performance. It would seem the concept of integrating the guaranty minimum price (GMP) regime to backstop the programme of buyer of last resort initiative with the supply of food grains to SGR silos will continue to be laden with challenges of poor delivery. There is, therefore, the need to be prudent in the application of GMP concept and to hasten the development of public-private partnership to meet the targets of the nation's SGR.
6. Giving the field challenges farmers experienced in accessing GES inputs, there is the need for: regular and continuous sensitization workshops for the stakeholders (farmers, processors, middlemen, suppliers, etc); capacity building, particularly on the use and handling of handsets and continuous registration of farmers; and increased monitoring and supervision of activities at redemption centres to minimize abuse
7. A national legislative support for enhanced and sustainable ATA programmes is advocated and should be pursued.
8. The problem of poor funding and ageing staff of ADPs is worsening. In order to ensure rapid agricultural transformation in the country, an urgent and innovative mechanism of funding agricultural extension service and supportive research endeavours, as well as a sensible reform of existing extension service are desirable.
9. There is paucity of data on livestock and fisheries production across the nation. It is critical to initiate the conduct of livestock population census and nationwide fisheries production survey in order to generate dependable livestock and fisheries data for proper planning.
10. After two years of implementation of ATA, it is considered not too early to set up specialist teams to conduct mid-term assessment of the programme to document the process of implementation and its achievements in order to enable consolidation of the programme and guide future initiatives.

Bumper yam harvest expected from this high productivity farm

1.0 Introduction

The annual Agricultural Performance Survey (APS) for the year was conducted between 26th August and 3rd September, 2013. The survey was carried out by the National Agricultural Extension and Research Liaison Services (NAERLS) in collaboration with the Federal Department of Agricultural Extension (FDAE) and several other stakeholders in agricultural data generation and use. The Agencies/Departments that participated in the exercise include, Planning Research and Statistics Department (PRSD) National Bureau of Statistics (NBS), Federal Department of Agriculture (FDA), Federal Department of Fisheries (FDF), Federal Department of Livestock (FDL), Federal Department of Rural Development (FDRD), Federal Fertilizers Department (FFD) and Nigeria Meteorological Agency (NIMET). Others include the Federal National Productivity Centre (NPC) and the six zonal Coordinating Research Institutes, Institute of Agriculture Research (IAR), the Lake Chad Research Institute (LCRI), the National Cereals Research Institute (NCRI), the Institute of Agriculture Research and the Training (IAR&T), National Institute for Oil Palm Research (NIFOR) and National Roots Crops Research Institute (NRCRI). A broad scope of participation has been maintained to sustain improvement in the quality, utility and depth of data generated from the survey.

The objectives of the survey were to: assess the agricultural performance during the wet season; make production forecasts; identify constraints to increased agricultural productivity and effective extension delivery service; and provide feedbacks for improved research and policy performance.

The annual survey has four strategic objectives which are:

- I. Assess the performance of agriculture/programmes during the year especially the wet season;
- II. Make production forecasts available
- III. Identify constraints to increase agricultural productivity and effective extension delivery service and
- IV. Provide feedbacks for improved research and policy performance

2.0 Methodology

Twenty multi-disciplinary teams of three scientists each were constituted, making a total of 60 scientists, to carry out the exercise across the country using Participatory Rural Appraisal (PRA) techniques. This involved the use of structured questionnaire/ checklists, farm visits/observations, interviews with farmers and Ministry/ADP officials. In every state, two communities were selected from two LGAs in each of two selected agricultural zones for evaluation. From each community, five farmers were interviewed in addition to focused group discussions held at every site. Final wrap-up sessions to validate data

generated were held at the end of each state visit with officials of the state ADPs and Ministries of Agriculture. Also, all the Green House Directors/offices were consulted and encouraged to complete the questionnaire on ATA activities in their respective states.

In the current report, the land area estimates made in 2012 are the base figures used in computing percentage changes in the areas devoted to various crops in 2013, while discounted output figures that provide for losses or damages caused by the massive floods that occurred in 2012 were used in computing the percentage changes in outputs between the two years under reference. The output figures were corrected in 2013 using actual yield estimates from 12 sample sites linked to geo-reference Decision Support Agricultural Tools (DSSAT). The summary of the findings of the survey in 2013 are presented below.

3.0 RESULTS

3.1 Rainfall Situation

North East Zone

Data from NIMET show that the rains started in May in 2013, as against April in 2012, for the zone, but they got established in June in Adamwa and Bauchi (Table 1). Substantial rainfall was received in Yobe and Gombe in 2013. In Adamwa and Yobe, rainfall volumes decreased in July but increased and remained stable until September. The highest volume of monthly rainfall of 750mm was received in Bauchi in August. Bauchi also recorded the highest total volume of rainfall of 2,022mm for the zone, compared to the 1,857mm received in 2012. This was followed by Gombe, with 1,051mm, as against the 1,173mm received in 2012. Altogether, more rain was received for the zone in 2012 than in 2013, except for Bauchi. The rains effectively stopped in October in both years across the zone.

North West Zone

The rains started in April in 2013, ceased in May and restarted in June, during which it became established and stable until it finally stopped in October. Jigawa had only a light shower in May; the rains increased in intensity in June until they stopped suddenly in September. Rainfall was stable in Katsina, starting from June and ceasing in September—but a remarkable drop in rainfall was recorded for the state in July. Jigawa had the highest total rainfall of 1,331mm in the zone, followed by Kano 1,009mm, Yelwa 895mm and Gusau 761mm. The least total rainfall of 648mm was recorded for Katsina in 2013.

North Central Zone

Rainfall in the zone started in March (compared to April for 2012). The rains were not quite established until late April and early May. Many of the stations recorded fluctuations in rainfall in 2013, with several degrees of dry spells across the zone, especially in Kwara. The rains stopped completely in October 2013, unlike in 2012 in which a few showers were received even after October. Rainfall totals were generally higher in 2012 than in 2013 across the zone, except for Ilorin station. Total rainfall was higher at Abuja (1610mm), followed by Makurdi (1513mm) in 2012. But in 2013, the highest total rainfall in the zone of 1319mm was recorded at Lokoja, followed by 1295mm in Makurdi and the least (920mm) in Ibi (Taraba State).

South West Zone

Several states in the zone received rainfall throughout the year, although the months of January, February, November and December had quite low rainfall; hence, they could well be classified as dry season months. Unlike in the other zones, the total rainfall was higher in 2013 than in 2012 in many stations. Total rainfall in the zone was, however, higher in 2012 than in 2013 at Abeokuta, Oshogbo and Ibadan. The usual August break prevailed in both years, which clearly marked out the two cropping seasons in the zone.

South East Zone

Data from the zone were similar to those of South West in respects of rainfall pattern. Rainfall commenced in January in virtually all the states in the zone, except Abia, where the first rain was recorded in February. Rainfall throughout the zone was generally higher in 2013 than in 2012. The total rainfall was higher in Abia, Imo and Ebonyi stations, while the Anambra and Enugu stations recorded lower rainfalls in 2013 than in 2012.

South -South Zone

It usually rains throughout the year in the South-South. But it did not rain in Ikom in January 2012 and in Ikom, Ogoja and Asaba in December 2012. The highest total rainfall for the country were recorded in the zone, at Uyo and Eket stations, which were well above 4,000mm. In 2012, the total rainfall at Ikom was as high as 5,115mm. Across the zone, total rainfall in 2013 was lower than that for 2012. As with the other two southern zones, August break in rainfall prevailed, although the volume of rainfall received during this month was substantially higher than in other zones.

RAINY DAYS

North East Zone

In the Zone, the total number of rainy days recorded was generally lower in 2013 than in 2012. The reduction in rainy days occurred across the stations monitored. Bauchi had the highest number of rainy days, followed by Yola.

North West Zone

The number of rainy days on a monthly basis decreased in 2013, compared with 2012, across the zone. The highest number of rainy days was recorded between July and September. But between November 2012 and March 2013 there was no rain.

North Central Zone

The number of rainy days at each station did not differ remarkably between the two years under reference. More rainy days were recorded in Jos, Abuja and Makurdi than at any other station. The highest number of rainy days of 23 was recorded at Abuja in the July of 2012. In 2013, the highest number of rainy days was 22. More rainy days were recorded between July and September than in other months. The number of rainy days reflected the level of rainfall even though it may not reflect soil moisture situation and related moisture-induced crop stresses.

South West Zone

The trend of rainy days at each of the stations across the zone varied slightly between the two years under review, except for August, when the number of rainy days was significantly lower in 2013 relative to 2012. At a few stations, significant differences between the two years were also recorded. For instance, at Akure, the number of rainy days was 7 in September of 2013, compared with 20 in 2012.

South East Zone

The trend in the Zone was similar to that of South West, although the rainy days were higher in 2012 than in 2013. Rainy days were as high as 25 and 26 at Umuahia and Enugu in July 2012. In 2013, the highest number of rainy days was 22 at Ebonyi also in July.

South-South Zone

The pattern of rainy days was similar to that of other southern zones, except that rainy days were higher in the South-South than elsewhere in the country. Most of the stations in the zone had rainfall every other day, as most had above 15 rainy days each month.

TOTAL MONTHLY RAINFALL (MM) 2013

Mean temperature did not differ remarkably between the two years in each zone. The months of March, April and May had the highest mean temperatures above 41°C, especially in the North West and North East.

Threshing of grains remain a manual operation

Borno and Adamawa provided farmers with improved seeds of rice and maize. The other states in the zone did not supply improved seeds in 2013. Despite the security challenges prevailing in the zone, it is instructive that some efforts were made to make inputs available to farmers. It may, however, be noted that the quantity procured and distributed was grossly inadequate. The record showed that rice seeds were made available by states; but the quantities supplied were unavailable. The primary source of seeds was the ADP.

States in the North-Central supplied improved planting materials to farmers. But Niger did not supply improved maize, rice and soybean seeds. Kwara, FCT, Kogi, Nasarawa and Benue provided maize and rice seeds, while only FCT, Kwara and Kogi supplied a total of 200MT of soybean seeds to farmers.

In the South West, no state supplied soybean to its farmers; but Ekiti, Lagos and Oyo provided improved rice seeds for their farmers. Ogun had no record of seed supply for maize, rice and soybean. Moreover, every other state in the zone, apart from Ogun, provided its farmers with improved maize seeds in 2013.

Available data showed that while Anambra and Imo provided 10MT and 4MT of maize seeds, respectively, Enugu alone provided about 376MT. But Enugu's data were linked to GES initiative. Data from two states of the zones (Imo and Ebonyi) were not available.

South-South Zone

Data from the zone showed that Akwa-Ibom provided maize seeds for its farmers in 2013. Records from other states in the region were not available.

Among the states in the North East, only Borno provided improved sorghum and millet seeds for planting in 2013. The source of both seeds was ADP outgrowers and Jilkur Seeds.

Northwest Zone

Most of the states in the zone made little or no effort at providing seeds to their farmers. Seed supply in the zone was more or less left entirely to GES of the Federal Government.

FCT, Kogi and Benue provided a total of 25,970 bundles of cassava cuttings, with FCT alone providing 22,500 for its farmers. Taraba, Nasarawa, Kwara and Niger provided no data on cassava cuttings, sorghum and millet seeds distributed during the season.

Ekiti, Osun and Ogun did not provide data on the supply of cassava cuttings, sorghum and millet seeds for farmers. The source of the cassava cuttings supplied in the zone was largely IITA.

South East Zone

There was no record of seeds supplied by states in the zone.

Akwa-Ibom provided its farmers with cassava cuttings, seed yam and telfaria seeds during the 2013 season. Cross River also provided 5,000 bundles of cassava cuttings. Edo, Delta, Bayelsa and Rivers, however, did not provide data on farm input supply, with regard to cassava, seed yam and telfaria.

South-South Zone

	Herbicides /pesticides			
State	Qty Proc	Qty Dist	Adeq	source
Akwa-Ibom	1.02 T	1.02 T	No	Accredited agents

Just as in other zones, supply of agrochemicals by states in the zone was almost non-existent in 2013. Of all the five states, only Adamawa supplied 1,000 litres of insecticides. The other states either did not supply or provided no data.

FCT supplied about 60,000L of herbicides, while Taraba and Kwara gave a supply of 1,488L and 0.6L of herbicides, respectively, to their farmers. However, only Taraba provided insecticides amounting to 12.5L. It is noteworthy that both states and the FCT made use of agents in the private sector, such as private agro-dealers.

Osun State supplied all the listed chemicals (herbicides, insecticides and fungicides) to its famers; these chemicals amounted to 5,046.89L. Moreover, while Lagos provided farmers with 120L of herbicides, Ondo supplied about 5,000L of insecticides. Oyo, Ogun and Ekiti did not provide data on chemical input supply for 2013. Ondo sourced its chemicals from the open market.

Only Imo provided data on provision of chemicals. Unlike the others, the state provided 650L of insecticides to its farmers in 2013.

In 2013, the South-South zone did not fare well in the area of chemical provision for its farmers. Only Akwa-Ibom provided 1.2T of herbicides for its farmers. The other states in the zone did not supply data in this area.

INPUT SUPPLY BY E-WALLET UNDER GES

Fertilizers Procurement & Distribution by e-wallet (GES)

Across the country, farmers received fertilizers that were distributed using the E-wallet platform of the Growth Enhancement Scheme of Agricultural Transformation Agenda.

North East Zone

A total of 1,379.65MT of fertilizers (NPK and urea) were received by farmers in Adamawa, while farmers in Gombe received 281,466 bags of fertilizers. Supply of fertilizers was reported to be early in both states.

North West Zone

Kaduna received and distributed 40,113 bags of fertilizers (NPK and urea); Kano received and distributed 538,829, 212,189 and 8,000 bags of NPK, urea and SSP fertilizers respectively. Kebbi received and distributed 129,013, 131,864 and 1,200MT of NPK, urea and SSP, respectively. Sokoto also received and distributed 284,230, 284,230, 5900 and 600 bags of NPK, urea, agrolizer and SSP fertilizers, respectively. Farmers reported that

distribution of fertilizers in Kebbi and Sokoto was late, unlike in Kaduna where these were early.

North Central Zone

Benue received 8037.95MT of fertilizers (NPK and urea). In FCT, 85823, 95931 and 2000 farmers obtained NPK, urea and SSP, respectively. Kogi received and distributed 261,943 bags of fertilizers (NPK, urea and SSP) among 127,572 farmers. Kwara received and distributed 106,900 bags of fertilizers (NPK and urea) among 83,700 farmers. The total of 38,844.6MT of fertilizers was distributed to farmers in Nasarawa, Niger and Taraba. All the states in the Zone reported early supply and distribution of fertilizers in 2013.

South West Zone

Ekiti, Lagos and Ondo received and distributed 102,744; 33,050 and 37,477 bags of fertilizers respectively, while Ogun and Oyo received and distributed 1,910.44MT and 9,857.05MT of fertilizers among farmers. There was report that the distribution exercise was late in Ogun, but early in Oyo.

South East Zone

Anambra received and distributed about 3618.3MT and 4,601MT of NPK and urea fertilizers respectively among benefiting farmers. Enugu distributed 188,095MT and 30,623MT of NPK and urea, respectively, while Imo received and distributed 1193.15MT each of NPK and urea to farmers. There was no information on Abia and Ebonyi. There was report that the supply and distribution of fertilizers in the Zone was fairly early.

South South Zone

Akwa Ibom and Rivers received and distributed a total of 262,510 bags of fertilizers. About 24,423MT of fertilizers were distributed to farmers in Bayelsa, Cross River, Delta and Edo.

Seeds, Seedlings and Stem Cuttings Distribution by E-Wallet

The survey data showed fertilizers and seeds received and distributed under the E-wallet programme of Growth Enhancement Scheme of Agricultural Transformation Agenda.

North East Zone

Adamawa and Gombe received and distributed 3058.92MT of seeds among farmers in 2013. Sorghum was supplied late in Adamawa, while other seeds were early. Sorghum, rice and maize were the major seeds distributed to farmers in the two states. Borno State also received 26MT of seeds. There was no information from other states.

North West Zone

Seed inputs were supplied late in Kaduna and Sokoto. Kaduna received and distributed 21921.19kg of maize and rice seeds. Kano received a total of 4003.1MT of seeds, comprising 160.43MT sorghum, 2382.72MT rice, 1259.95MT maize and 200MT soybean. In Katsina, a total of 810MT of rice paddy was distributed among farmers. Kebbi received and distributed sorghum (70MT), rice (1582.3MT), maize (118.83MT), cotton (25MT) and soybean (115MT). Sokoto received and distributed 15,758 bags of sorghum, 1250.6MT rice, 60MT maize and 100Mt of cotton seeds.

North-Central Zone

All seeds and cuttings were supplied early in Benue, FCT and Nasarawa. Benue received and distributed 2,445 bundles of cassava cuttings, 745.52Mt of maize, 605.40MT of rice and 90MT of soybean. FCT also received and distributed 22,500 bundles of cassava cuttings and 1064.64MT of other seeds (maize, rice and soybean). Kogi received and distributed 16,859 bags of rice and 15,703 bags of maize seeds. A total of 1,145MT of seeds (maize and rice) and 45,000 bundles of cassava cuttings were distributed among farmers in Kwara. Nasarawa received and distributed maize (911.54MT), rice (166.77MT) and cassava cuttings (6,945 bundles).

South West Zone

All seeds, seedlings and cuttings were supplied late in the South West. All the states received and distributed seeds of maize and rice. Cassava cuttings were also distributed among registered farmers in Ekiti, Lagos, Ondo and Oyo. And 64,000 cocoa seedlings were shared among farmers in Oyo.

South East Zone

Supply of maize and rice seeds was early in the Zone. A total of 424MT of rice and 1035.41MT maize were distributed to farmers in Anambra, Enugu and Imo. There was no data from other states.

South South Zone

About 11,000 farmers received vitamin A-enriched cassava cuttings. In Cross River, 6000, 90,000 and 3,000 farmers benefited from the distribution of cassava cuttings, maize and rice, respectively. Two thousand and five hundred (2,500) tons of seeds (maize and rice) were distributed among farmers in Rivers under the GES scheme.

Insect attack is one of the challenges of growing Millet

General Comments from Some States on the GES Sheme

Bayelsa: Suggestions for moving ATA forward

- Input supply should be early in February
- There should be sensitization to encourage youths to embrace agribusiness
- Provision of extension staff

Critical problems encountered

- Untimely supply of input
- In adequate resources and equipments for cultivation of large areas
- Lack of extension workers
- Lack of access to credits

Oyo: Suggestion for moving ATA forward

- Improve funding of the state Green Houses
- Improved communication and linkages between the value chain teams and Green House

Critical problems encountered

- Poor funding of Green House hindered effective monitoring of programme
- Delay in the commencement of GES activities
- Low awareness owing to poor sensitization and enlightenment
- Widespread poverty among farmers which affected input redemption.

Edo State

The fertilizers supplied were NPK and urea, while maize and rice (paddy) were the seeds supplied. No fingerlings, feeds and medications were supplied. The inputs arrived late and supplies were through the E-wallet system. Access to credits was difficult.

Osun: Suggestions for moving ATA forward

- Timely implementation of each commodity value chain
- Timely supply of agricultural inputs

Niger State

The comments showed that inputs arrived early in the state. Farmers were happy with the GES scheme, but some complained of difficulty in reading text messages in English.

Kogi State

- Training on how to use and handle handset, farmer's registration procedure and proper channel of communication should be carried out to avoid confusion. Many farmers were not yet fully aware of the GES scheme and the need to educate the farmers and all concerned on the scheme was emphasized.
- More redemption centres should be established to enable smooth redemption. The supply chain manager, in collaboration with agro-dealers, should help establish more redemption centres closer to the farmers, and more manpower should be available at the centres.
- The number of bags of fertilizer given to the farmers should be increased in order to improve agricultural production.
- Delivery of inputs should be done latest by March.

Katsina

One redemption centre was operated per LGA in the state. More redemption centres (3-4) were desired to bring the inputs closer to farmers. Timely provision and aggressive sensitization at the grassroots is also recommended.

Gombe

At least 140,733 farmers got 2 bags of fertilizers (NPK and urea). Though seed inputs came late, access to fertilizers was early enough. But farmers complained of non-accessibility to credit facilities.

Ondo

There was high awareness level of GES among farmers. Most of them said they received fertilizers and maize seeds through the scheme. However, there were a few complaints of the inputs not arriving on time or were inadequate. There were two main problems

mentioned: poor GSM network connectivity, so that reply to the received SMS was difficult; and late arrival of fertilizers.

Lagos

Most of the farmers interviewed were aware of ATA, especially its GES component through which they received fertilizers, seeds and cassava cuttings. However, they complained that the inputs arrived late or were inadequate. There were three main problems listed: poor GSM network connectivity, especially those on

Habit of food vending remains a challenge across the country

the Visafone network; lack of access to fertilizers even where their names are shown at the redemption centres, because they did not receive text messages; and late arrival of inputs. Moreover, the farmers were so happy with GES that they proposed:

- Coverage of all aspects of agricultural production by the scheme.
- Arrangements for input provision under the GES should start as earlier as possible, bearing in mind that farm activities start at different times in different locations, so that farmers can have timely access to inputs.
- GES inputs redemption centers should be located within reasonable distance of farm communities to minimize the money farmers spend on transport.

Crop Pests, Diseases and Natural Hazards

The field data showed the major incidence of diseases, pests and natural hazards on cultivated crops during the 2013 cropping season. Stem-borer and quelea bird attacks on maize, rice and sorghum were light to moderate, with 5-15% estimated yield loss. This was similar to what was reported in 2012 (table 7). Striga infestation remained a problem in maize and sorghum fields, especially in FCT, Taraba and Kano, where its damage was moderate; its effect was greater in 2012, inducing about 35% loss.

Cassava mosaic was the most common disease of cassava farms in Adamawa, FCT, Lagos, Katsina and Bayelsa, although only a marginal yield loss of 10-15% was recorded. Attack of rodents and grass-cutter on cassava was reported in Imo, Ondo, Akwa Ibom, Rivers, Kogi and Edo, while destruction of maize and cassava fields by monkeys was reported in Kwara. The estimated cassava yield loss due to pests was less than 20%, compared to that of 2012, which was 30%. Beetle infestation on yam was reported in Ekiti, Imo, Anambra, Akwa Ibom, Rivers, Ondo and Bayelsa. The beetle attack was light; a 3-15% yield loss was posted—this was lower than the 10-20% loss observed in 2012.

Cabbage and garden egg are now popular features in emerging cropping systems in peri-urban settlement farms

The natural hazards experienced in 2012 were substantially absent in 2013, except in a few pockets of production domains, such as Sokoto and Lago. This means higher scope of production outputs. Generally, yield losses in 2013 owing to natural hazards were negligible, compared with those of 2012. Incidences of pests, diseases and natural hazards on crops production may have resulted in slightly lower losses of yields for 2013.

Table 7: Summary of incidences, severities and management options for pests, diseases and natural hazards on crops

Crops Infested/infected	Pests/Diseases/Hazard	Affected States	Severity	Estimated yield loss (%)	Control measure(s)
Maize	Quelea birds	Gombe, Adamawa, Ekiti, Enugu, Kwara	Light-Moderate	10-20	Scaring, cultural practices
Maize	Stem borer	Ekiti, FCT, Imo, Anambra, Akwa Ibom, Ondo, Kogi, Kano	Light Moderate	10-12 15	Chemical, integrated pest management (IPM), use of improved varieties
Maize	Downy mildew	Adamawa, Edo	Moderate	20	Resistant variety
Maize	Damping off		Moderate	20	Seed dressing
Maize	Termite	Kano	Moderate	14	Application of Worm-force (Cabofuran 3G)
Maize	Grasshoppers	Gombe,	Moderate	12	Ground spray, Fumigation
Maize	Dry spell	Osun, Ogun, Kebi, Zamfara, Niger, Taraba	Moderate	15-25	Use of drought tolerant variety, replanting

Tractor availability

The promotion of agricultural mechanization usually is to avert drudgery and the attendant negative effect of low work output. It is also intended to raise agricultural production from subsistence level to large scale or commercial level. Agricultural mechanization creates wealth and promotes rural industrialisation and in the same vein, provides the necessary anchor to boost sustainable agriculture.

Tractors are used with various farm implements and equipment for several farm tasks from land preparation through planting to harvesting, processing and storage. For these reasons, tractor services is indispensable, thus the need to know the status of tractors, availability and functionality in Nigeria. However, out of the 36 states and FCT, 14 States including FCT did not have complete information on Government tractor availability and functionality in 2012 and 2013. The reported total numbers of Government owned functional tractors in Nigeria were 1,072 in 2012 and 1,372 in 2013, representing an increase of 27.9%. Non-functional Government tractors across the states were 738 and 822 in 2012 and 2013 respectively, which shows an increase of 11.4% in numbers of non-functional tractors while comparing 2012 and 2013. Record for the privately owned functional tractors were 1,264 and 761, for 2012 and 2013 respectively, representing a rapid decrease of 66%, while non-functional tractors were 351 in 2012 and 453 in 2013.

North West had the largest number of tractors in all the zones with 629 and 617 in 2012 and 2013 respectively, followed by South West with 141 and 462 in 2012 and 2013. North East had 124 and 107 in 2012 and 2013 respectively, South East had 149 in 2012 and 59 in 2013, and South-South had 61 and 55 in 2012 and 2013 respectively while North Central had the least number of tractors in 2013. Katsina State had the highest number of Government owned tractors with 538 across the states, followed by Benue State with 148, while twelve States had the same number of tractors as that of 2012. Only six States provided information on tractor availability and functionality for private owned tractors in 2012 and 2013.

The number of States with record on privately owned functional tractors was 19. Adamawa is in the lead with 290 functional tractors owned by private individuals/organization in 2013 followed by Oyo State 186 and Jigawa with 174, while FCT had the least of 15 in both 2012 and 2013.

The total number of functional tractors owned by both Government and private/organizations, as obtained from the States' ministries of agriculture in the entire country was 2,110 and 1,780 in 2012 and 2013 respectively, representing a decrease of 15.6%. This shows gross inadequacy of tractors compared to the area of land for cultivation. This is an indication that Nigeria is under-tractorized. Consequently, in order to increase the total areas of land for cultivation, necessary actions should be made to sustain the available functional tractors and put the non-functional ones in good conditions. If this is properly done and complemented with other agricultural farm inputs, the desire for attainment of food sufficiency and subsequent export, as the goal of the present agricultural transformation agenda would be achieved.

Prices of some tractor operations

The cost of tractor operations for the year 2012 was not significantly different from 2011 except in Benue State where there were 72%, 90% and 120% increase in prices of ploughing, harrowing and ridging respectively. Plateau State however recorded a decrease of 40% in all the operations

considered. North Central and North West agro-ecological zones had the highest price of tractor operation with an average mean of N11, 607 per ha for ploughing. Kaduna State recorded the highest operation price for ploughing at N26, 250/ha and the least average prices were recorded for ploughing and harrowing operations at N5, 813/ha and N5, 000/ha in the South West and North East respectively.

There was not much difference in price between 2012 and 2013 for harrowing operations across the six agro-ecological zones. North West had the highest cost for harrowing at an average price of N8, 250 per ha in 2013. For the ridging operation, the highest average price was recorded in the North Central at N11, 263 in 2013 while North West had the least price of N5, 607 per ha. Among all the States across the federation, Imo State had the highest price for harrowing and ridging operation of N20, 000/ha.

Problems of Tractorization

Some of the problems identified affecting tractor availability and functionality in 2012 still persist in 2013. These were high cost of purchasing new tractors, scarcity of spare parts especially rural communities, fuel adulteration, frequent breakdown of tractors and lack of skill tractor operators and mechanics. The cost of animal traction services for the year 2013 was almost the same with 2012. Most States (78%) did not have record on animal traction. Only Adamawa, Kebbi, Niger, Katsina, Gombe, Jigawa, Plateau and FCT had record.

Animal drawn implements ready for distribution at Funtua, Katsina

Work bulls were the preferred animal power used in 2013. Number of animals used for traction in Adamawa in 2012 and 2013 were 1,500 and 1,800 respectively which represented an increase of 16.7%. Kebbi State also had an increase of 99.2% in number of animals used for traction between 2012 and 2013. Gombe State reported an increase from 55, 000 in 2012 to 67, and 450 in 2013. Animal traction in Katsina State remained popular and supported by government. The number of

animal drawn implements provided by Katsina State government remained comparatively higher than that of many other states.

Some of the problems identified on agricultural mechanization in 2012 were:

1. No standard workshops for tractor repairs
2. Non availability of tractors during peak demand periods
3. High cost of tractor hiring
4. Non availability of simple modern irrigation technology
5. High cost of tractor maintenance
6. Lack of training for tractor operators

7. High cost of work bulls for animal traction
8. Low work output for animal traction
9. Lack of adequate feed supplement for animals
10. Lack of training centre on animal traction
11. Heavy agricultural equipment in bad conditions litter around in every state
12. Inadequate animal health care for animal traction

With these aforementioned problems and the continuous decrease in number of functional tractors, it is imperative to arrange for after sales services of non-functional tractors across the country. Services to be rendered by tractor distributors and marketers should include training, supply of spare parts availability and establishment of repair shops at the strategic locations across the country.

Cost of Production of Major Crops

This section reviewed the relative production costs for major crops grown across the states of the country. Production costs for the major crops are shown on Tables 1 through 8. Generally, the production cost of crops increased remarkably across all agro-ecological zones of the country.

Production cost of a hectare of sorghum increased by 28.7% and 21.7% respectively in Bauchi and Katsina states in the year 2013 when compared to 2012. The highest increase in production cost for maize was recorded in Enugu, Nassarawa and Taraba states which were 49.4%, 32.7% and 31.3% respectively. In Enugu, Bayelsa and Anambra States, significant increases of 35.4%, 33.3% and 20.8% respectively in the cost of production for rice were recorded.

The cost of production of Root crops generally increased in many states. Nassarawa recorded a 63% increase in production cost of cassava, while FCT reported a significant decrease of -34.4% between 2012 and 2013. This is quite interesting because costs of factors of production especially land and labour is expected to be higher in the FCT than in Nassarawa state. Imo state recorded a 25% increase of production for cocoyam. Niger and Nassarawa States reported a 25% increase each in cost of yam production per hectare.

Production cost for various commodities in Bayelsa state could not be validated and were excluded in the analysis.

As mentioned earlier, and could be observed in the following tables, a significant increase in the costs of production of major crops was reported from almost all States and all agro-ecological zones over the two years under review.

The increased costs of production are related to increase in inputs prices across the five agro-ecological zones. The other key factors contributing to the increased costs include:

- a) The over dependence of traditional agriculture on human labour,
 - b) Farmers' inadequate access to labour saving devices that can minimize costs of production cost, and maximize farmers' revenue, and
 - c) High prices and scarcity of quality farm inputs such as fertilizer, improved seeds, and pesticides might have also contributed to the increase in cost of production observed.
 - d) High cost of credits
- Obviously, the subsidies applied to key inputs such as fertilizers and seed under the ATA/GES is yet to substantially impact on the cost of production.

Grain Reserves

STRATEGIC GRAINS RESERVES:

The Strategic Grains Reserves in accordance to its policy for 2012/2013 was able to store at least 5% of the total food grains produced in the country. The reserves also provides food during the period of stress e.g after the 2012 flood, act as a last resort for farmer's products and work in collaboration with States and NGOs on commodity marketing and price stabilization

GOVERNMENT SELLING PRICES

Government usually sells at discounted subsidized prices ranging from 20 – 50% of buying price.

Constraints of the Strategic Grains Reserves

Lack of adequate funding to stock the silos and poor participation of the private sector has been identified as major constraint to the grains reserve. Other constraints include bureaucratic bottlenecks that delays prompt response by the scheme, lack of data, capacity gaps amongst various stakeholders and transportation.

Recommendations for Improving performance of the Strategic Grains Reserves scheme in Nigeria

1. Increased funding to stock silos especially with corresponding increase in production as a result of the Agricultural Transformation Agenda (ATA).
2. Silo concession and leasing of unused spaces to the private sector
3. Kick-starting of the proposed e-pilot Warehouse Receipt System (e-WRS)
4. Reduce bureaucracy so that GMP prices could be effective and also allow prompt response to market price forces
5. Increase funding of the National Bureau of Statistics (NBS) as well as the Databank unit of the Planning Research & Statistics Department of the FMARD to enable them collate and analyze data and make such available to the public.
6. There is need for regular & continuous sensitization workshops for the stakeholders (Farmers, Processors, middlemen, Marketers etc. to to improve their understanding of the importance of the strategic Grain reserve programme of government to enable them contribute to it.
7. Improve rural feeder roads and revitalization of the rail system which has the capacity of transporting thousands of tons of grains at relatively lower cost.

Commodity Prices

General price increase occurred during the first half of the two years (2012 and 2013) under review for most commodities especially maize, millet and rice. Increase in maize price was highest in Taraba (138%) and Imo (117.4%) states. High changes in millet prices were reported from Nassarawa (60.45%), Benue (46.5%) and Katsina (43.4%). Kwara State reported a 36% increase in the price of rice, followed by Katsina and the FCT that had 25% increases. The changes in the price of maize, millet and rice were however comparatively low in Kaduna (13.63%), Jigawa (8.9%) and Jigawa (-0.14%) respectively.

Increases were reported in the prices of sorghum, cowpea and benniseed. Highest price increases for sorghum and cowpea at 80% and 100% respectively were recorded in Gombe state. Katsina state reported a 100% increase in benniseed price. Most of the states reported a price increase of less than 20% for soyabean with the exception of Adamawa (185%), Ebonyi (57.14%) and Enugu (45.8%).

High increases in cassava tuber prices were reported in the states of Kaduna (522.9%), Nassarawa (481.0%), Niger (411.9%) and Oyo (127%). Gari prices were highest in Edo (550%) and Kogi (92.41%) states. The sharp increase in gari price in Edo and Delta States emanated from demands from flood affected states. Most of the camps set up were substantially maintained on gari and other simple consummable food stuff. The potential of gari as ready-made food for emergency situation was more apparent in 2013 than in any previous year as result of the massive flood that occurred in 2012.

Kaduna State reported a significant reduction of 123% in gari price. Akwa-Ibom State reported an increase of 173% in the price of cassava flour.

Significant increases in the price of yam tuber were reported in Akwa-Ibom (90.2%), Kaduna (89.3%) and Nassarawa (76.3%) states. Osun and Ebonyi States on the other hand, reported price decreases of 68.7% and 61.1% respectively for yam tuber. Plateau State reported a 55% reduction in yam flour price. Taraba State posted a 250% increase in sweet potato price, while in Katsina State, 38% increase was recorded.

Moderate increases in prices were recorded for goat meat, beef, and mutton. Highest price increase for goat meat was reported by Imo (64.7%), Ogun (42.9%), Kwara (37.9%) and Enugu (31.1%) states. Beef price increased by 48%, 42% and 30% in Cross River, Nassarawa and Edo States respectively. Increases in mutton prices were highest in Jigawa (47%) and Ebonyi (31.25%).

The price of chicken and eggs also increased remarkably during the same period. Chicken prices increased by 109% in Ogun State, 47% in Nassarawa State and by 44% in Zamfara State. Unlike the rest of the country; Lagos State recorded a 27% decrease in price of chicken. The highest increase in the price of eggs was recorded in Nassarawa state (47%), then Oyo (30%), followed by Yobe and Adamawa with 20% each. Osun state recorded a 4% fall in egg prices.

Fresh fish price increased in Enugu State by 70% and 40% in Niger State. Edo State posted a 45% reduction in the prices of fresh fish. Little data was recorded for frozen fish prices. Highest increase in dry fish prices were recorded in Imo (85%) and Niger (65%) states. Adamawa State reported a 26% increase in the price of dry fish while in Ebonyi state, the price of dry fish dropped by 30%.

Mango fruited heavily in 2013 and presents huge opportunity for investments along its value chain especially in making of concentrates and juice

FARMERS ASSESSMENT OF CROPPING PERFORMANCE

This report presents farmers' assessment of the agricultural performance survey conducted in the 36 states of the federation including the Federal Capital Territory (FCT Abuja). A group questionnaire and an individual questionnaire was administered in order to gather data from farmers on rainfall situation, input use, pest and diseases, livestock, fisheries, farmers' groups/association, climate change, Agricultural Transformation Agenda and crop production. A total of 741 farmers were interviewed using a set of structured questionnaire.

It was of paramount importance to know whether subsidized fertilizer and seeds being procured by the government through the Growth Enhancement Support Scheme (GES) was reaching farmers and what farmers' responses are regarding the inputs supplied by government during the year. The assessment covered all the six geo-political zones, i.e. North-West, North-East, North-Central, South-West, South-East and South-South Zones.

RAINFALL SITUATION

Interactive interviews with the farmers' group revealed that rainfall established very early in April for meaningful agricultural work and there was even distribution throughout the growing period.

Farmers affirmed that the rains were not as high as last year (2012) both in terms of quantity and number of rainy days. However, Akwa-Ibom, Jigawa, and Kano states experienced rains far higher than year 2012 which resulted in flooding of farms in some parts of the states. The worst hit local government areas were Ibiono-Ibom, Uyo, Itu, Uruan, Ikono and Ikot-Ekpene Local government areas of Akwa-Ibom state; and Kiyawa, Garki and Gumel local government areas in Jigawa state. The rains started early in most parts of the South-West Zone, South-East Zone and the South-South Zone between the month of February and March. In Cross-River state, the rains started in the month of January, while in most part of the North- West Zone, the rains came a little bit late establishing between the month of May and June. A dry spell was experienced in all the states which lasted for about 14 to 40 days. The amount of rain and the length of rainy season recorded was normal, unlike 2012, in which unprecedented floods affected 27 states resulting in the loss of lives, destruction of farmlands and livestock.

INPUT USE

The major sources of seeds are seeds saved by farmers. About 25% of farmers obtained improved seeds from the government. About 7.5% of them bought from the open market and 67.5% from the seed saved by other farmers. Farmers save seeds for future planting season because some they found that some improved seeds did not perform well.

Not all farmers can afford to buy improved seed supplied by the seed companies because the cost which they consider prohibitive.

Pesticide use continued to expand owing to increased pressure on the lean labour. As a follow up to the 2012 APS, the trend of pesticide usage was considered. The trend showed increased use of pesticides that has warranted huge importation of this product. The import trend is a phenomenal rise which should warrant a strategic planning for local manufacture. In essence, building local manufacture capacity is a growth enhancement incentive for the agriculture sector in line with established policy of import reduction or substitution. Indeed, report from 2013 show that farmer’s dis-satisfaction with use of pesticides especially herbicides stem from lack of requisite skills to use, poor quality of available products and lack of access/understanding of key recommendations.

The use of organic manure in combination with inorganic fertilizer is a common practice among farmers, except for farmers in Delta and Edo states who did not indicate the use of organic manure. The inorganic fertilizer mostly used by farmers is NPK and Urea. Few farmers (11.15%) make use of SSP and only 3.66% make use of Lime.

Figure 2: shows the percentage of farmers that use the different types of inorganic fertilizer.

More percentage of farmers as high as 66.13% received government input as they were able to buy fertilizer, seeds and pesticides at government source compared to what was obtainable in previous years. This achievement can be attributed to the Growth Enhancement Support Scheme of the Federal Government to transform agriculture and strengthen food security. Bayelsa and Rivers states recorded low use of fertilizer among farmers.

Few farmers (≤ 5) in Bayelsa, Benue, Borno, Delta, Edo, Ekiti, Rivers and Yobe bought fertilizer from government sources. In Adamawa, Anambra, Bauchi, Gombe, Kaduna, Kebbi, Kwara, Ondo, Plateau, Sokoto and Zamfara States, slightly more farmers (≥ 15) were able to buy from government sources. Farmers who bought fertilizer from the open market are 5.81% less than farmers that bought from government source. About 15.25% of farmers could not purchase fertilizer in the year 2013 which is about 16.4% lower than farmers who were unable buy from government in 2012.

Figure 3: source of fertilizer bought by Farmers.

Most farmers (80.1%) hire labour. Extra labour is usually needed for activities as such land clearing, planting, weeding and fertilizer application. Respondents give the time for hiring labour *per* man day as 8 hours. Farmers in the northern states pay the lower rates than the farmers in the southern states who pay higher fee. The labour cost for major farm work operations such as land clearing, planting, weeding and fertilizer application slightly increased compared to the year 2012. The cost of operation was between ₦500.00 and ₦1, 500.00 per man day.

PEST AND DISEASES

Incidence of pests and diseases were minimal in most of the states. Cases of diseases such as striga and army worm in maize and sorghum, nematode attacking garden egg and yam, weevil in cowpea and birds infestation in rice and sorghum are prominent as many farmers attest to the damage caused to their crops. The severity was generally moderate.

AGRICULTURAL TRANSFORMATION AGENDA

All the 36 states and FCT, Abuja are involved in the Agricultural Transformation Agenda (ATA) programme of the Federal Government. Majority of the farmers said that they are aware and have benefitted from the subsidy through the Growth Enhancement Support Scheme but farmers in Borno, Delta and Yobe states are yet to benefit from it. Fertilizers and seeds were received under the GES Scheme at the cost ranging from ₦6, 000 to ₦7, 000 for 2 bags (1bag of NPK and 1bag of Urea) with either 25kg of rice seed or 20kg of maize seeds depending on the choice of the farmer at an approved subsidized rate. Farmers received inputs through the e-wallet system whereby

they go to the redemption centres to redeem their inputs. Inputs by the GES Scheme were affordable but inadequate in quantity.

The state governments of Kaduna, Kebbi and Zamfara procured and distributed fertilizer at ₦1,000 per bag. Most farmers reported that fertilizer supplies were readily available this year in the markets but, were however too expensive for local farmers to purchase.

Despite the cost, many farmers could afford to apply optimal fertilizer levels compared to what was obtainable last year. Coupled with the fact that rains have been favourable so far and increase in acreage of land, final yields are expected to be 30-40 percent more than last year, 2012. Farmers (87.18%) indicated that organic manure was used to augment the purchased inorganic fertilizer. This suggests that organic manure is of importance to farmers and should be encouraged. Many farmers (15.25%) use no input at all, but depend on natural soil fertility to grow their crops. Almost two-third of the farmers interviewed (84.75%) used chemical fertilizers. Availability and high costs are the two factors that influence fertilizer use. 15.25% of the farmers who had stopped using fertilizers attributed it to the high cost of the commodity. Encouragement of farmers through inputs subsidy can go a long way to make the nation self sufficient in food production as well as to earn foreign exchange from the exportation of agricultural products.

TRACTOR USAGE

A few farmers (35.63%) still hired tractors for cultivation of land for the year 2013. However, tractors were hired more from private organization/individuals in the year 2012 (25.00%) than the year 2013 (20.51%). More farmers (11.47%) were able to hire tractor from government source than what was obtainable last year (7.58%). About 64.37% of farmers were not able to hire or use tractor for their farm operations. Cessation in tractor use in Abia, Akwa_Ibom, Delta, Imo and Rivers States is attributed to non-availability and the high cost of hiring. The cost of hiring a tractor is far beyond the reach of smallholder farmers even when a tractor is available. In order to plough and harrow one hectare of land a farmer needs between ₦10,000 – ₦15,000.

Figure 3: Indicates the number and percentage of farmers that were able to afford hire of tractor from the three available sources. 85 (11.47% hired from Government sources; 152 (20.51%) hired from private sources; 5 (0.68%) from Govt & Private and 22 (2.97%) from Cooperatives. About 477 (64.37%) of farmers had no access to tractor hire services.

Fig 4: Source of tractor used

PROBLEMS ASSOCIATED WITH THE GES SCHEME

The process of the GESS is still inefficient because most of the targeted farmers could not access subsidized inputs - fertilizers and improved seeds. Those who did had to pay more than the government subsidized rate of ₦2, 750 per bag for the two bags allotment. Fertilizer subsidized by government continues to be diverted and end up in the market to be sold to farmers at exorbitant prices. Millions of farmers who were registered in 2013 have not been captured in the national farmers' database and so could not benefit from the programme. Some farmers who are so poor sold off their bags of fertilizers for little profits and some agro dealers sold the subsidized inputs meant for the farmers to traders who later resold them at ₦6, 000 per bag in the open market. Also, farmers are deprived of the subsidized inputs as they are made to undertake repeated visits to the redemption centres without being able to redeem their inputs. Moreover, the number of redemption centres is very low which cannot be able to serve the millions of farmers in the country and the existing ones are too far for farmers' access.

In some states especially Ondo and Ekit states, the maize seeds provided were reported to be susceptible to streak. Some of the seeds had some off-types.

FARMERS' NEEDS FOR GOVERNMENT INTERVENTION

According to the farmers, their most urgent needs are fertilizers, tractors, seeds, herbicides and credit in that order; followed by control of pest and diseases, farmer training, flood control, irrigation pumps and communication between farmers, research and extension. Accessibility to agricultural innovations and machinery by farmers is also very important to boost agriculture. Problems such as pest hazards, weed control, moisture insufficiency, soil fertility, farm credit, labor shortage and soil erosion should be addressed by the government as soon as possible. Information regarding agricultural inputs, agricultural technology, and agricultural credit and marketing issues needs to be timely at every farming season so as to ensure increase in farm productivity.

On-farm advisory service is critical to productivity increase

Simple on-farm water reservoir farmers could adopt to store water for irrigation

Crop Estimates

CULTIVATED LAND AREA AND PRODUCTION ESTIMATES OF CROPS IN 2013

Crop area and output figures for 2012 and 2013 are presented in the following tables. It should be noted that the figures herein presented for 2012 reflects adjusted figures based on 2012 forecast. Each year, adjustments are conducted that are reflected in the National report. In essence, while the figures for 2013 are forecast, that of 2012 presented herein (2013 Report) are adjusted figures of 2012 forecast. The figures for 2013 are also forecasts and will be subjected to adjustments that will be presented in 2014 national report. Adjustments are conducted following validations based on established indicators for each commodity.

Maize

Maize is produced in all agro-ecological zones of Nigeria. In 2012, the total estimated land area devoted for maize production in Nigeria was about 5,676,620 ha indicating a 3.9% increase compared to 2012 estimates. Output increased from about 8.7 million tons to 10.28 million tons in 2013 representing about 19.4 % increase in total output. The crop had recorded spectacular increases in output in all the zones of the country. The highest maize area increases of about 6 % were recorded in both South West and South East Zones in 2013 over 2012 figures. The other zones recorded marginal increases of maize area of between 2 and 3.4 %.

Similarly, output levels increased across the zones despite the civil unrest in parts of the country. Maize output figure for 2012 factored on discounts and provisions for losses induced by the massive flooding that occurred during that year. This probably made the increase in out put looked more remarkable. Indeed, maize output forecast for 2013 is 10,279,620 tons which is about 19.4% increase over that of 2012. Across the states and zones, maize output increased with

the highest level of increase of 42% occurring in Kogi State and other states recording between 15% and 34 % increase. The impetus for expanding increase in maize production can be linked to increased consumption, GES incentive with seeds and fertilizers, promotion of drought and Striga tolerant varieties which is enabling farmers cope better with climate change manifestations, the ease of its preparation and the expanding poultry industry. Despite the remarkable increase in output, demand –supply deficits remain which should warrant increased efforts to expand production further.

Fig 5:

Sorghum

Sorghum is mostly grown in the northern states of Nigeria. About 1% increase was recorded in land area from 5,385,220 ha in 2012 to 5,438,860 ha in 2013. The production of sorghum which dropped in 2012 compared with 2011 increased by about 4.8% in 2013. The North Central zone had recorded increase of about 18.3% with Niger, Kwara and Benue accounting for much of the increase that occurred in the zone during the year. The Far East states in the North East Zone posted negative output figures for sorghum obviously due to the crisis in the zone. It will seem the elaborate provision of production incentives by the state and federal Governments were negated by the crisis.

Fig 6: Sorghum Output (x1000 MT) in Nigeria Zones

Rice

Rice is a national staple food in Nigeria, and is being grown in all agro-ecological zones of the country. The estimated cropped area for rice in 2013 was 2,981,940 ha which represent an increase of about 3.9% over 2,871,300 ha cultivated in 2012. Owing to the Federal Government’s initiatives under the country’s Agricultural Transformation Agenda (ATA) especially for the Rice Value Chain improvement, rice recorded substantial burst in production in 2013. All the zones recorded increases in the output of rice in from the the least 2.4 5% in the North East Zone to 11.4 % in the North West Zone in 2013 over 2012 figures. The level of output increase on a national scale is about 6.9 % from 5,444,410 tons to 5,817,920 tons of paddy produced in 2013.

Fig 6: Rice Output (x1000 MT) in Nigeria Zones

Millet

Millet is cultivated in the northern states of Nigeria on an estimated crop land area of 1,369,800 ha in 2012 and 1,404,960 ha in 2013. It is found in 3 agro-ecological zones of the country. The North West zone is the major producer of this crop followed by North Central and the North East zones. In 2013 the crop recorded a marginal increase in output of 2.6% when compared with that of 2012. It is remarkable that the usual practice of planting millet as a first crop following establishment of the rains is giving way to late planting as the last crop in the northern guinea savannah. The practice is leading to reversal of the declining trend in millet production having initially lost production area to maize following development of early and extra-early maize

vairieties. The emerging trend is that millet now follows earlier planted cereals in a sequence in many states such as Kaduna and Niger states

Groundnut

Groundnut is produced mainly in the northern states of Nigeria; however some few southern states also produce little amounts of groundnut. The estimated land area put to production of groundnut in 2013 was 2,720,970 ha which is an increase of 5.1 % over 2,661,650 ha in 2012. The major producers of groundnut in the country are Nassarawa, Niger, Kano, Jigawa, Katsina, Benue, Taraba, Gombe, Adamawa, and Zamfara states. Although most of the zones recorded marginal increases in the production of groundnut, the South West zone however posted the highest increase of 3.3% in the production in 2013. The estimated output on a national scale recorded an increase of 2.2%.

Fig 9: Groundnut Output (x1000 MT) in Nigeria Zones

Cowpea

Cowpea is cultivated mostly in the northern states of Nigeria. The total estimated land area put to production of cowpea in 2013 was 3,586,330 ha; an increase in the cowpea area of 3% over 3,480,570 ha cultivated in 2012. The North East and West zones are the highest producer of cowpea contributing almost 70% of the cowpea that is produced in the country. Output figure for cowpea in 2013 show an increase of 1.1% when compared to that of 2012.

Fig 10: Cowpea Output (x1000 MT) in Nigeria Zones

Soybean

Soybean, like cowpea is mainly produced in the northern parts of Nigeria. The total estimated land area put to production of Soybean in 2013 was 669,030 ha representing an increase in soybean area of 2.9% when compared with 2012 figure of 649,880ha. The North Central and North West zones are the major soybean producing areas accounting for about 96.70% production. The major producing states are Benue, Kaduna, Taraba and Nassarawa.. The crop is an important cash crop to farmers and a very good raw material for the extraction of oil and cake;; and in compounding feeds for livestock and poultry.

Fig 11: Soybean Output (x1000 MT) in Nigeria Zones

Cotton

Cotton is one of the most important fibre crop in Nigeria with a total estimated output of 288,870 tons in 2012 which increased to 296,310 tons in 2013. The estimated crop land area of cotton increased by 2.6% in 2013 over, 2012. Production of cotton especially the long staple varieties in some states in the South West are on the increase. The major producers of cotton in Nigeria are Katsina, Zamfara, Kano, Kaduna, Gombe, Adamawa and Borno and Bauchi states. The land area of cotton had recorded an increase of 3.1%, a margin that is higher than its output of which most of it came from production in Katsina, Zamfara and Niger States. Before 2012, cotton production was on the decline progressively. The new interest and incentive to produce cotton stem from a growing demand following the resuscitation of the textile companies that started in 2012 and continued in 2013.

Fig 12: Cotton Output (x1000 MT) in Nigeria Zones

Benniseed

Benniseed is an important oil seed crop that is cultivated mainly in the North Central, North West and the North East zones and some level of production in some other zones. It is produced on an estimated land area of 519,280 ha in 2012 which increased to 537,290 ha in 2013. The land area increased by 3.5% in 2013 over 2012 figure. Its output decreased marginally from 422,980 MT in 2012 to 407,870 MT in 2013.

Yam

Yam is a very important tuber crop in Nigeria that is found in all agro ecological zones of the country. The total estimated land area put to production of yam in 2013 was 5,083,620 ha recording an increase of 5.1% when compared to 2012 which was 4,837,680 ha. The North Central zone is the major producing zone, followed by the South East zone and North West zone. The output of yam in the country had recorded a marginal increase of only 10.6% when compared to 2012. Indeed, 2013 was a year for yam.

Cassava

Cassava like yam is cultivated in all agro ecological zones of Nigeria. Estimated cassava area in 2013 was 6,718,490 ha reflecting about 1.1% increase over 6,644,180 ha produced in 2012. The major producer of cassava is the North central zone, followed by the South-South and South West zones. Cassava is one of the major root crops in the country that did not record a significant change in its output in 2013. An increase of about 6.0% in output was the forecast for the crop in 2013 when compared to what was obtained in 2012.

Cocoyam

Cocoyam is cultivated across the country. The area devoted to cocoyam production in 2013 was estimated at 631,920 ha which represent about 1.5% increase over 2012 estimate of 622,700 ha. The forecast for output of Cocoyam is expected to record an increase of 2.0% in 2013 over 2012 figures, which is from 3261,150 to 3,326, 260 tons.

Vegetables

Three major vegetable crops were surveyed in 2013, namely tomato, onion and okro. Tomato is cultivated in all the agro ecological zones of the country. The output of tomato had increased by 1.6% in 2013 when compared to what was obtained in 2012. Onion is cultivated mainly in northern states of Nigeria with very little amounts in the south west zone. The production of onion increased marginally in 2013 by 1.5% when compared to 2012. Okro is grown in all agro ecological zones of Nigeria with a total estimated crop land area. The production output figure of okro increased by 1.8% in 2013.

Fig 17: Tomato Output (x1000) MT in Nigeria Zones

Fig 18: Onion Output (x1000) MT in Nigeria Zones

Fig 19: Okro Output (x1000 MT) in Nigeria Zones

Ginger

Ginger is an important spice crop cultivated mainly in the North West and North central zones. However, the South west zone produces ginger. The land area for ginger production is estimated at about 152,510 ha in 2012 and increased to 164,440 ha in 2013, which is 7.8% increase over 2012 figure. Similarly, ginger production increased by 8.7% in 2013 compared to what was obtained in 2012.

Mixed Cropping is still the preferred cropping system among small scale farmers

Livestock

Livestock production in Nigeria is an integrated economic activity which contributes around 5 – 6% of the Gross Domestic Products (GDP) and about 20% of the agricultural component of GDP. Livestock therefore plays a major role in the socio-economic development of the nation. Between 70 – 80% of the nation's population are engaged in agriculture and livestock industry as their major occupation and source of livelihood. However, livestock sub-sector of agriculture in the country has been faced with some constraints which limit the rapid and needed development of the sector.

During this year's APS, many factors were reported to limit the development of the livestock sub-sector of agriculture in the country. These limiting factors vary from area to area, and species to species. They include the upward swing in the incidence of cattle rustling and relate communal conflicts, low genetic potential of the native livestock with regards to feed conversion and reproduction, low quality of available feed ingredients, prevalence of diseases

and parasites and inadequate supply of livestock inputs such as veterinary supplies and feed concentrates.

Livestock population

The estimated livestock population and livestock commercial farms in Nigeria for 2013 are presented in

Table 5a. As in other years, data on livestock remained elusive and basis for proper forecast cloudy. Data on livestock population and livestock commercial farms were reported by only 10 states of the federation. Cattle population estimates were reported by Ekiti, FCT, Imo, Kaduna, Kano and Taraba. Those of Poultry, sheep and goat populations were reported by Anambra, Enugu, Ekiti, FCT, Imo, Kaduna, Kano and Taraba. Anambra, Enugu, Imo, Kaduna and Taraba state reported population of pigs. However, only Taraba state reported the existence of rabbits in the state.

Our Heritage and struggles

The Federal Capital Territory reported the highest numbers of commercial livestock farms. Data on livestock population and livestock commercial farms were not reported owing to the non-conduct of livestock census which had been overdue for more than 10 years.

Planning for the livestock sub-sector will continue to be laden with difficulties for so long as the base data for such endeavour and the proposal for livestock census remain un-attended.

Poultry farms are expanding and increasingly modernizing and boosting maize production

Fisheries

Fisheries Input

Data for Aquaculture and Fisheries were not available in most of the states. Only 7 states have procured and distributed one input or the other in the year under review. Niger, FCT, Kaduna, Sokoto, Bayelsa and Ekiti states procured and distributed fish feeds. Aquaculture equipment like fingerlings, Fish meals, culture tanks, brood stock, drugs and pelleting machine were procured by these states. Only Sokoto State procured equipment for capture fisheries like Fishing nets, Fishing hooks and Fishing boats.

The reason for this scanty information on Fisheries is that the questionnaires for the ministries were not submitted by most states. Also, Fisheries is under the ministry of water resources in some states hence their report could not be captured.

Locally fabricated smoking Klin

Table 20 shows the GES support to fish farmers in 2013, following the launching of the GES fisheries by the Federal Department of fisheries in August 2013. Fish farmers were delighted across the country for such an innovation by the Government. For many of them it was a welcome development since that has never happened in the aquaculture industry in Nigeria. It was a bold step by Government to tackle two critical issues in aquaculture development-fish seeds and fish feeds. The cost of the standard 15kg bag of treating fish feed and water test kits (where available) were subsidized by 50% while catfish juveniles from reputable hatcheries were distributed free.

Table 20 is a summary of documentation from the exercise in 9 states (especially from the South-West, North-Central, North-West) and the FCT. While 8,400 farmers were target beneficiaries, 6,624 fish farmers (about 79%) were reached. About 3.7 million Catfish juveniles were distributed i.e. 95% of the target quantities. For fish feed, 36,585 bags of 15kg each (nearly 550 tons) were distributed, while water test kits were distributed only in Ekiti State.

The water kits are normally patronized by elite farmers that can use them, although they are scarce to get in the market. Since the Nigerian aquaculture industry is fast growing, the GES support to fish farmers across the country will further encourage more farmers to embark on fish production, thereby increasing fish protein availability to the Nigerian population.

Fisheries Diseases

Aquaculture productions were affected by various diseases as reported in the table below. These diseases include bacterial, fungal and viral diseases. Broken skull disease was reported in Adamawa State. Fungal Viral and Bacterial diseases were reported in Kano, Kogi, Enugu, and Ekiti State. Fish parasites such as Predators such as wild ducks, Kingfishers and reptiles were reported in Bayelsa and Kogi States.

This is a major challenge to fish farmers because of lack of technical knowhow and manpower in disease diagnosis and treatment. Poor feeding, insufficient water supply and poor management of fish stocked is another challenge faced by the fish farmers. There is urgent need to train fisheries technical staff on fish diseases prevention, diagnosis and treatment to forestall losses encountered when farmers are faced with these challenges. Fish farmers if possible should be trained on how to produce their feeds using locally available but nutritionally balanced feed resources.

Many concret fish ponds are like this warranting the need for capacity building for improved mangement

Table 22: Fisheries Pests and Diseases Situation

Fish species	Pest/diseases	States Where Reported	Severity	Control Measures undertaken
Clarias spp.	Broken skull	Adamawa.	50-60%	No control measure was taken.
Clarias spp. Clarias spp.	Fungal and viral infection. Bacterial diseases.	Kano,Kogi. Enugu,Adamawa,Ekiti, Kogi,	High High in Adamawa, but light in other states.	No control measures. Enugu and Ekiti treated the fish with NaCl. But no medication was given in Adamawa and Kogi State.
Clarias spp.	Columnaris	Imo	Light.	No control measure.
Clarias spp.	Pest like wild duck, kingfisher, Reptiles.	Bayelsa,Kogi	High in Bayelsa but light in Kogi	No control measure was undertaken.
Heterobranchus	Skulls pot.	Bayelsa	Low.	No control measure was undertaken.

Fisheries Production Estimate

Data from five states on artisanal fisheries output in 2013 showed a decreased in fish production in Bayelsa State and Niger State from 68,048mt to 36,101 compared with 2012 and 73,300 in 2012 against 45,000 in 2013 respectively. This included both inland and coastal artisanal fisheries. About 20 states had no data on fisheries output which included both artisanal and aquaculture production in the year 2013. However, there was increase in fish production for three states which include Ekiti, Enugu ,and Benue states.

Domestic Fish production by Sector

ADP Extension Activities

ADP Funding and Staffing Adequacy in 2013

The overwhelming problem of poor funding and its untimely release has grossly affected the staffing situation of most of the ADPs across the nation. The survey shows that only FCT, Nasarawa, Ogun and There wasn't any significance difference in the funding situation of ADPs between 2012 and 2013. Majority of the ADPs are poorly funded by the state government, which generated staff redundancy problems in the affected ADPs across the country.

In some states where parallel extension delivery agencies are established like ADIL and FSAC in Adamawa state, ADP staffs are seconded to serve as resource personnel. Evidence from the survey shows that only Adamawa, Nassarawa and Ekiti (5% of the ADPs) had little funding in 2013. The funding problems is reflected more in Borno, Zamfara, Kaduna, Delta, Edo, Taraba, Osun, Ondo, Lagos, Anambra and Akwa Ibom. The remaining ADPs were either fairly funded or information regarding funding was not available during the survey period.

For most of the ADPs, the neglect in terms of funding stem from the erroneous assumption that payment of counterpart funds for some development project sufficed.

Many state governments will need to be assisted to understand the justification for continued funding payment of counterpart funds notwithstanding.

Women dominate postharvest ops.

Oyo ADPs like the rest of the ADPs reported inadequate staff. Similarly, majority of ADPs are heavily loaded at the top with aged personnel who are on their last lap of their service. To save the ADPs from collapsing the problem of staffing should be urgently addressed and funded to recruit more qualified front line EAs.

Table 28 Status of ADP Funding, Adequacy and Quality of Staff in 2013**North East Zone**

State	Funding		Adequacy and quality of staffing		Remarks
	2012	2013	2012	2013	
ADAMAWA	Poor	Good	Fair	Inadequate	Funding increased in 2013 but more extension agents should be employed.
BORNO	Poor	Poor	Inadequate	Inadequate	Funding should be provided while more extension agents should be employed.
GOMBE	Fair	N.A	Fair	Inadequate	Funding should be provided and more extension agents should be employed.
YOBE	Fair	Fair	Inadequate	Inadequate	There is need for more funding and more EAs should be recruited.

North West Zone

State	Funding		Adequacy and quality of staffing		Remarks
	2012	2013	2012	2013	
KADUNA	Very good	NA	Inadequate	Inadequate	Funding should be improved while more low cadre extension staff should be employed.
KANO	NA	NA	Fairly adequate	Inadequate	Funding records should be available and more Extension agents should be employed to meet the standard EAs/Farmer ratio.
JIGAWA	Fair	Fair	Fairly adequate	Inadequate	Funding and EAs staffing should be improve
KATSINA	N.A	N.A	Very inadequate	Very inadequate	Funding should be provided and more EAs be recruited
KEBBI	Fair	Fair	Inadequate	Inadequate	Funding should be improved upon and more Staffs should be recruited
SOKOTO	NA	NA	Inadequate	Inadequate	There is need for adequate funding and staffing
ZAMFARA	Fair	Poor	Inadequate	Inadequate	Improved funding is required and more EAs staff is needed.

	2012	2013	2012	2013	
Anambra	Fair	Very Poor	Inadequate	Inadequate	Adequate and timely funding should be provided and sufficient staffing of EAs is needed.
Enugu	No fund released	No fund released	Inadequate	Inadequate	Funds should be released on time while more staffs should be employed.
Imo	No fund released	No fund released	Inadequate	Inadequate	Funding should be timely and adequately released and more extension agents should be recruited.
Abia	Fair	Fair	Fairly adequate	Fairly adequate	Funding should be provided and more extension agents should be recruited.
Ebonyi	No fund released	No fund released	Fairly inadequate	Fairly inadequate	Fund should be timely and adequately provided and more frontline EAs should be recruited

South South Zone

State	Funding		Adequacy and quality of staffing		Remarks
	2012	2013	2012	2013	
Rivers	N.A	N.A	Fairly adequate	Fairly adequate	Provide funds and recruit additional staff especially VEAs.
Bayelsa	Fair	N.A	Very inadequate	Very inadequate	Provide adequate and timely fund and recruit more staff.
Akwa-Ibom	Fair	Poor	Adequate	Fairly adequate	Funding should be adequate and timely while more extension agents (VEAs, BEAs) should be recruited.
Cross River	N.A	N.A	Fairly adequate	Fairly adequate	Funding should be provided and more EAs should be employed.
Edo	Fair	Fair	Inadequate	Inadequate	Fund should be adequately provided and low cadre extension staff needs to be recruited.
Delta	NA	NA	Fairly adequate	Fairly adequate	Adequate and timely funding is very essential and agricultural extension agent need to be recruited.

Performance indicators of ADPs

Performance of any public, private/non-governmental extension organisations is dependent upon on certain indicators among which are its strength in term of man-power and financial adequacy as well as approved targeted activities. These indicators are presented in table? Base on geopolitical location and states bases.

Farm families

Comparable to 2012 this year Kano state was also recorded the highest number of farm families of 994,656. This was followed by Niger State with 763,000 and Borno State with 536,322. In most of the state farm families of the 2013 remain the same with that of 2012. This may be as result of ATA programme executed across the country, which pull many families into agricultural production

EA: Farmer ratio: this year Rivers, Edo, Benue, Abia and Sokoto, States have the highest EA: Farmer ratio with 1:9583, 1:9409, 1:7407 and 1:6000, 1:5265 and 1:4050 respectively. Unlike in 2012 where Adamawa state appeared to have the lowest EA:FFs ratio of 1:1212, in 2013 Gombe state became the state with lowest EA:FFs ratio of 1:996. The variation in EA:FFs ratio over the years is due to ADP poor funding and staff motivation.

Number of Subject Matter Specialists (SMSs): The SMSs are the main link between research institutes and the ADPs. Proven and relevant technologies from research are taught by the SMSs to the VEAs. Feedback to research as a way of evaluating progress is also achieved through the SMSs, especially during Fortnightly Trainings (FNTs) and Monthly Technology Review Meetings (MTRMs). Hence, the availability of SMSs in different agricultural enterprise – crop, livestock and fisheries, agro-processing and women-in-agriculture – remains a major performance indicator in the ADP system. Akwa-Ibom, FCT and Bauchi States have the highest number of 35 and 31 SMSs. Adamawa, Jigawa and Kebbi have 20 SMSs each. Also Ekiti has 18 SMSs, while Sokoto State ADP has the least number of 5 SMS. Commonly, there was low number of SMSs across the country and this might affect the training of EAs and transfer of improved agricultural technologies to the farmers.

Number of Block Extension Supervisors (BESs): The BESs are important supervisory force of any extension services delivery institutions predominantly ADPs. The number of BESs should ideally depend on the number of VEAs. Across the country many ADPs have reasonable number of BESs who can adequately supervise their subject EAs. Kano and Jigawa states ADP have the highest number of 133 and 47 BESs followed by Benue and Niger with 33 BESs each. However, Osun has the lowest number of 3 BESs.

Number of Village Extension Agents (VEAs):

There is a marginal differences between 2012 and 2013 in the number of Extension Agents in many states. However, there is sharp decrease in EAs number in Adamawa Jigawa, Zamfara, FCT, Kwara and Edo. The decrease in number of EAs in those states may not be unconnected with retirements, moterlity and movement of staff to other jobs. It appears that Kano State which has the largest number of VEAs in the country followed by Yobe and Niger states that have 265 EAs each and 198 VEAs for Kebi state. However, Osun, Katsina and Edo have 5, 12 and 27 EAs respectively. When comparing the number of EAs between 2012 and 2013 only Niger and Abia have increases their number of EAs by 73 and 33 respectively while Adamwa state VEAs decrease by 137.

Number of Extension Visits to Farmers: Extension visit to farmers is an important performance indicator of any extension organizations that assess the intensity of technology awareness and adoption by farmers. However, many state ADPs like Kebbi, Kano, Taraba, FCT, Niger, Kwara, Ebonyi, and Delta did not perform any farmers-visit in 2013. In contrast Zamfara, Nasarawa, Plateau and Ondo states EAs paid many visits to their farmers.

SPAT, MTP and OFAR: The success in technology dissemination and adoption by farmers depends on the number and effectiveness of SPAT, MTP and OFAR techniques conducted by ADPs. There is a slight increase in of ADPs that conducted these activities, however, the intensity of the activities decreased in 2013 compared to 2012. About 18, 10 and 7 ADPs established MTP, SPAT and OFAR respectively. ADPs in Akwa Ibom, Imo, Zamfara and Benue established 2548, 893, 837 SPATs respectively. Similarly Imo, Zamfara, and Benue conducted 600, 510 and 429 MTPs correspondingly, while Jigawa, and Kaduna states conducted 12 and 10 OFAR individually.

FNTs/MTs and MTRMs/QTRMs:

Success in technology dissemination and adoption largely depends on regular training and meetings of frontline VEAs which is usually conducted through FNTs/MTs and MTRMs. FNTs was conducted by 57% of the ADPs in 2013 against 59% when compared to 2012. The slight decreased in number of FNTs was due to financial and other logistic problems facing the ADPs. Likewise 46% of ADPs conducted MTRM in 2013 against 65% in 2012. This ia reduction 19%. The survey reported that only Nasarawa and Kwara met their MTRM and QTRM targets in 2013.

Number of farmers trained:

Information regarding number farmers trained this year remain the same with that of 2012 in which 60% of ADPs did not conduct any direct training for farmers. It was recorded that Nassarawa, Kaduna, Osun, and Yobe trained highest number of 24,240, 11,200 3375 and 850 farmers who were trained in 2013. The number of farmers trained in Nassarawa and Kaduna State increased in response/support of Aflatoxin awareness

trainings conducted in these states. Response from farmers and EAs during the survey indicates that technical messages to end-users were sustained via radio and television programmes on national and states media stations.

Farmer Field School:

Farmers field schools were not maintained in Borno, Adamawa, Katsina, Kebbi, Kano, Kaduna, Plateau, Niger, Osun, Edo, Delta, Cross river, Akwa Ibom, Gombe, Sokoto and Ogun states in 2013. The following states of Kogi, Ondo, Anambra, Oyo and Imo states had the highest number fo FFSs recording 1350, 110, 75, 45 and 44 respectively. However, Rivers had the lowest number (10 nos) 1 FFS seesions followed by FCT and Bayelsa that had 9 FFSs each.

A typical yam market in Nassarawa State

TRAINING NEEDS OF ADPs IN 2013

The Training needs assessment of the 36 State Agricultural Development Programmes (ADPs) in the country is presented in the table below.

Almost all the ADPs indicates their training needs with exception of very few who failed to provide data on their training needs. As illustrates in the table, generally the trainings needed were location-specific. In many instances, the kind of training required were needed by two or more ADPs, these included: data processing and analysis, extension management, GPS application in extension, ICTs, in-service training of staff on academic programmes. Correspondingly the key areas in which trainings were needed were: and data collection processing & analysis (19.4%), ICT training (13.8%) redemption process on GES (11.1), pre- season training, capacity building of extension staff and other technical staff, in-service training, monitoring and evaluation and training the trainer (TOT) on extension services each bearing (8.3%). Value chain approach training (5.6%), group formation and dynamics (2.8%) and others details is presented in the table below..

Regular training of staff is a major constraints faced by ADPs in Nigeria. Over the years, the main hindrance to training has been shortage and untimely release of funds. These resulted in non-recruitment of qualified and adequate extension staff couple with inability to sustain regular training of existing personnel by most of the ADPs across the nation. Since agricultural information is a public good, a key implication of the current situation for policy, is the need for state governments to adequately fund the ADPs. Although many farmers in Nigeria are not ready to pay for private extension services in Nigeria due to the nature of their economy and production patterns which seems to be peasantry, nevertheless the ADPs should look inwards and direct more effort towards exploring alternative ways of raising funds to support their activities.

Many options exist for research organisations regarding funding of ADPs in the country. All stake holders concern with agricultural extension transformation should consider implementing all suggestions that seems reasonable for effective funding of extension services and personnel development of the ADPs. The Agricultural extension support pillars need urgent re-enforcements if a bird eye perspective of containing poverty and hunger is desired to trigger expected economic growth.

Table 30: Training needs of ADPs in 2013

S/No.	Subject Matter of Training needs	No. of ADPs requesting training	Percentage of ADPs requesting training
1.	Data collection and Analysis	7	19.4
2.	CDD Approach (Community Development)	1	2.8
3.	Value chain on all the commodities	2	5.6
4.	Pre-season training	3	8.3
5.	Post-season	1	2.8
6.	Redemption process on GES	4	11.1
7.	Capacity building for extension staff and other technical staff	3	8.3

***Multiple responses**

Training needs identified for farmers

1. Skill for Irrigation agriculture (practices)
2. Pesticide handling usage technologies
3. Dry season agriculture especially- rice, wheat, vegetables, Tomatoes, maize- Apple, grape vine, dry season seed production
4. Mechanisms for efficient tractor leasing services
5. Skills for tractor maintenance and repairs
6. Mechanisms for efficient community –based seed production scheme
7. Decision support tools/techniques for estimation of crop yields
8. Fish feeds formulation using local resources
9. Grass cutter production techniques
10. Snail rearing techniques
11. Acha Production and processing
12. Use of telephone in extension service
13. Techniques for propagation and establishment of Shea butter tree plantations and processing
14. Techniques for mushroom production (identification of edible species and promotion)
15. Record keeping and management of agribusiness

Table: 31

FIELD PROBLEMS AND PROBLEMS NEEDING RESEARCH ACCORDING TO STATES AND ZONES

states	Crops	Livestock	Fisheries	Agro forestry	Irrigation eng.	Extension	WIA	OTHERS
Adamawa	Drought tolerant varieties Early maturing varieties Diseases tolerant varieties especially rice	Improved breeds of livestock Artificial insemination for cattle	Provision of new and improved fish smoking devices Improved fish farming technologies and good marketing services	Review of forest laws Provision of high yielding and disease resistant orchard crops like mango Provision of adequate grazing land to cattle rearers (conflict between fulani and farmers)	New and easily maintained water pump machine Building of adequate borehole for irrigation activities Restoration of sustainable tractor hiring services in the state	Enlighten farmers on effective use of pest and herbicide Capacity building of extension agents	Methods of processing and preservation of crops and vegetables	
Bauchi								
Borno	Lack of adaptation, Underutilization of sorghum and jatropa, and Climatic change adaptation.	the areas are tick control, and diseases like Ehlichiosis.	Resource utilization and management, especially, water and land resources are the major areas needing research.	issues of land and water supply management, improved seedlings, and introduction of new parts form the basis for research considerations	resource utilization and management, especially, water and land resources are the problem areas needing research in the state.	Adaptation process and method, input back-up method and timing, and technical back stopping are part of the problem needing research in the areas of extension.	Research and dissemination of research outcomes and findings especially Fruit and vegetable preservation, improvement and use of fuel efficient stoves are the problem Women Agriculture face in Borno state.	
Gombe	Yam and Potato production Weed management and control	Artificial Insemination (AI)	Tilapia production Fish feed	Improved mango varieties Fruit processing	-	Trial on Organic farming Trial on micro and	Processing and packaging of fruits and vegetable	

GENERAL CONSTRAINTS

This section highlights the general constraints documented from the field and from the various agricultural agencies in each state of the zones. The constraints discussed under this section concern mainly extension activities and farm inputs; some other constraints are captured randomly, depending on their presence in a zone. For almost all the states of the federation (about 90 percent of the 36 states and FCT), the lack of funding and shortage of extension staff occurred for the year under study. There were also the general problems of late and/or untimely release of farm inputs; lack of staff mobility, and high market prices of inputs. Specifically, these constraints are discussed according to zones in Tables 1-6).

Table 32: General constraints from the Northwest Zone

S/N	Constraint	State Affected
	Extension Activities	
1	Delay in release/ non-payment of counterpart fund	Kaduna
2	Poor funding/ Lack of funding for extension activities	All states in the zone
3	Inadequate staff capacity (expertise)	Sokoto, Kebbi, Kaduna
4	Inadequate extension staff	All states in the zone, except Kano
5	Lack of utility vehicle (mobility) for extension activities	Sokoto, Zamfara, Katsina,
	Farm Inputs	
6	Exorbitant prices of inputs	Sokoto, Kebbi, Katsina, Kano
7	Poor quality/adulterated inputs (seeds and chemicals)	Sokoto, Kebbi, Kaduna
8	Unavailability/poor quality of improved stock (livestock/ fisheries)	Sokoto, Kebbi,
9	Inadequate farm inputs (seeds, fertilizers, chemicals, etc)	All states in the zone, except Kano
10	Untimely release of farm input	All states in the zone, except Kano
11	Non availability of farm inputs (tractors, fertilizers, etc)	Sokoto, Kaduna
12	High cost of labour	Katsina,
	Others	
13	Poor state of infrastructure (roads, power and water supply, inadequate GSM coverage, etc)	Sokoto, Zamfara, Kaduna
14	Inadequate grazing reserve	Sokoto,
15	Non-linkage between ADP/state government and ATA Initiative	Zamfara, Sokoto
16	GSM Network problem in the GES e-Wallet scheme	Zamfara

For the northwest zone (Table 32a), Kano state seemed to be outstanding in its performance. Certain cross-cutting constraints, such as inadequate farm inputs, untimely release of inputs, and inadequate ADP staffing were present in all the states of the zone, except Kano. But the problem

of insufficient funding was recorded for all the states in the zone. Kaduna alone recorded the non-payment of counterpart funds, while Katsina and Sokoto recorded high cost of labour and inadequate grazing reserves, respectively, as serious constraints.

Table 2: Northeast Zone

S/No.	Constraints	State affected
	Inputs	
1	Resistance of pests to pesticides	Adamawa
2	High cost of inputs (seeds, chemicals, etc)	Adamawa
3	Absence of drought-tolerant varieties	Adamawa
4	Adulterated inputs	Adamawa, Bornu
	Extension staff/ funding	
5	Inadequate funding	Gombe, Bornu, Yobe
6	Inadequate staff (extension staff)	All the states in the zone
7	Coordination between state and federal government	Adamawa
8	Staff motivation (farming, transportation)	Gombe, Bornu, Yobe
9	Lack of permanent office	Yobe
10	Exorbitant cost of media airtime	Adamawa
	Others	
11	Lack of modern smoking kilns for fish	Adamawa
12	Lack of labour-saving devices for fruits and vegetables	Gombe, Adamawa
13	Need for fuel-efficiency stoves	Gombe, Bornu.

Major constraints of North East Zone state ministries of agriculture and DPP from the field this year have to do with inadequate extension agent, staff motivation that is training and retaining of extension staff to strengthen the extension activities finding is very crucial in extension delivered and this is inadequate in Northern East Zoner Agricultural inputs that are adulterated affect the feed security and production.

Table 3: North-Central Zone

S/NO.	Constraints	States affected
1	Exorbitant cost of livestock feeds	FCT
2	Improved fish formulation	Kwara, FCT
4	Inadequate/high cost of farm inputs	Benue, Taraba, Kogi, Niger.
6	Adulterated farm inputs (chemical, seeds, pesticide)	Kwara, Kogi, FCT
	Extension Staff	
7	Lack of staff	All the states in the zone
8	Poor motivation	Nasarawa
9	Inadequate kits	Kogi
10	Lack of mobility	All the states in the zone
	Others (diseases)	
13	Cocoyam dieback	Kwara
14	Lack of indigenous pest control method	FCT

Major constraints from the field this year for North Central Zone, specifically the states in this zone are faced with problems of lack of qualified extension agents, lack of lack of qualified extension agents, lack of mobility for extension activities, inadequate and high farm input supplies. Other problems such as improved fish formulation, adulteration of pesticides which affected the yield of crops and provision of GES early the year for bumper harvest.

Table 4: Southwest Zone

S/N	Constraint	State Affected
	Extension Activities	
1	Lack of funding for extension activities	All states in the zone
2	Dilapidated/absence of office space	Lagos
3	Lack of/inadequate ICT infrastructure	Lagos
4	Inadequate staff capacity (expertise)	Ekiti, Lagos, Ondo
5	Inadequate extension staff	Ekiti, Osun, Lagos, Ondo
6	Damaged, non-functional equipment (tractors, vehicles, etc)	Ekiti, Lagos
7	Lack of utility vehicle (mobility) for extension activities	Ekiti, Lagos, Oyo
	Farm Inputs	
8	Exorbitant prices of inputs	Ekiti, Osun, Lagos, Ondo
9	Poor quality/adulterated inputs (seeds and chemicals)	Ondo
10	Inadequate inputs (seeds, fertilizers, agrochemicals, etc)	Ekiti, Osun
11	Untimely release of inputs	All states in the zone
12	Non availability of inputs (tractors, fertilizers, etc)	Ekiti, Lagos
13	High cost of labour	Ekiti, Osun, Oyo
	Others	
14	Lack of/insufficient market linkages for produce	Ekiti, Osun, Lagos
15	Rural-urban migration of able-bodied youths	Osun, Lagos
16	Unchecked crop/livestock diseases and pests	Ekiti, Osun, Lagos
17	Poor state of infrastructure (roads, water supply, etc)	Ekiti, Lagos, Ondo
18	Postharvest losses/ lack of reserves/preservation equipment	Ondo
19	Non-linkage between ADP/state government and ATA Initiative	Lagos, Ondo
20	GSM Network problem in the GES e-Wallet scheme	Osun

For the Southwest, data for Ogun State were not available for analysis. But there was a general problem of inadequate/lack of funding across the zone; a problem of inadequate number of staff in all the states, except Oyo. Lagos ADP alone had the problems of dilapidated office space and lack of ICT infrastructure. Ondo alone recorded poor quality/adulterated farm inputs and the problem of postharvest losses/lack of reserves and preservation equipment, while Osun reported a problem of GSM network failure with regard the e-wallet scheme.

Table 5: Southeast Zone

S/N	Constraint	State Affected
	Extension Activities	
1	Non-payment of counterpart fund	Enugu
2	Lack of funding for extension activities	Imo, Anambra, Enugu

	Inadequate staff capacity (expertise)	Imo, Anambra, Enugu
3	Inadequate extension staff	Imo, Anambra, Enugu
	Lack of/inadequate ICT infrastructure	Imo, Enugu
	Lack of utility vehicle (mobility) for extension activities	Imo, Anambra, Enugu
	Farm Inputs	
1	Exorbitant prices of inputs	Imo, Anambra, Enugu
2	Poor quality/adulterated inputs (seeds and chemicals)	Imo, Enugu
3	Unavailability/poor quality of improved stock (livestock/fisheries)	Anambra, Enugu,
4	Inadequate inputs (seeds, fertilizers, agrochemicals, etc)	Imo, Anambra,
5	Untimely release of input	Imo, Enugu
6	Non availability of inputs (tractors, fertilizers, etc)	Imo, Anambra, Enugu
7	High cost of labour	Enugu, Anambra
8	Damaged, non-functional equipment (tractors, vehicles, irrigation equipment, etc)	Imo, Anambra, Enugu
	Others	
9	Lack of/insufficient market linkages for produce	Enugu
10	Unchecked crop/livestock diseases and pests	Anambra,
11	Poor state of infrastructure (roads, water supply, etc)	Imo, Anambra,
12	Postharvest losses/ lack of reserves/preservation equipment	Imo,
13	Crop farmer/herdsmen conflict	Imo, Enugu
14	GSM Network problem in the GES e-Wallet scheme	Imo,
15	Non-linkage between ADP/state government and ATA Initiative	Enugu, Imo

In the southeast zone, data for Abia and Ebonyi were not available. Interestingly, no particular constrain was reported across the states. For example, only Enugu reported non-payment of counterpart fund as a major constraint. Imo State reported peculiar problems of postharvest losses and GSM network service failure in the GES e-wallet scheme; both Enugu and Imo reported crop farmer-herdsmen conflict and inadequate ICT infrastructure. Moreover,

Table 6: South-South Zone

S/NO.	Constraints	States affected
	Inputs	
1	Highest cost of Agro-chemicals	Rivers, Cross Rivers,
2	Late supply of inputs	Rivers, Cross Rivers
3	Quality of fish feed not available in market	Akwa Ibom, Cross Rivers
4	High cost of fishing input	Akwa Ibom, Cross Rivers
5	Obsolete Agro-chemicals	Akwa Ibom
6	Post harvest produce management	Akwa Ibom, Cross Rivers
	Extension Activities	
7	Shortage of extension frontline staff	All states in the zone
8	Lack of training for staff	Akwa Ibom, Cross Rivers, Delta
9	Incentives and logistics for extension staff	Delta
10	Lack of funding	All states in the zone
11	Nonpayment of counterpart funds	Delta
12	High cost of TV Production Air Line	Akwa Ibom, cross Rivers.
13	Absence of vehicles	All states in the zone

State ministries of agriculture and ADPs in the South-South experienced the problems of shortage of frontline extension staff; there was also the general lack of regular training on the job; absence of vehicles and funds are major issues in extension delivery. These weakened extension activities in the zone. For the farmers, there was the lack of effective postharvest management techniques.

RECOMMENDATIONS

The following recommendations are made based on data collected, interactions with stakeholders in agriculture, observations during the survey and regular field feedback through the six NAERLS zonal offices:

- 
1. Weed control remains one of the critical challenges in crop production that is largely conducted manually. The fact that the youths are losing interest in agriculture due to its drudgery makes pesticide use attractive. The increase of pesticide importation is therefore likely to continue to grow and the nation stands to benefit enormously by devising policy and special financial incentives that can boost local manufacture of pesticides.
 2. Government had made modest investments in the provision of tractors, but lack of processing machines and effective tractor repair centers are constraining optimal use of the tractors, value addition and expansion of production. In order to encourage youth participation in agriculture, significant investment in mechanization/processing machines including local fabrication and repairs as well as cottage level processing skill development are required.
 3. Agribusiness is knowledge driven and skill supported, it calls for deliberate nurturing efforts to raise new generation of successors from among currently unemployed agriculture related fields graduates/youths via a special youth empowerment and engagement scheme.
 4. A renewed interest in agriculture is being stimulated by ATA leading to increases in output, yet output markets for agricultural commodities remain uncertain because of quality, grading, weight and measure issues.

In order to consolidate on the gains of ATA and to sustain the trend, it is imperative that private sector led grains (agricultural commodity) feature markets are developed supported with grass root orientation/training programs to accelerate adoption of weights and measures and compliance with quality/biosafety standards.

5. Across the country the earmarked silos for strategic grain reserved were largely empty because of poor contract performance. It would seem the concept of integrating the guaranty minimum price (GMP) regime to backstop the program of buyer of last resort initiative with the supply of food grains to the SGR silos will continue to be laden with challenges of poor delivery. There is a need therefore to be prudent in the application of GMP concept and to hasten the development of public private partnerships to meet the targets of the nations' SGR.
6. Giving the field challenges farmers experienced in accessing GES inputs, there is the need for:

- Regular & continuous sensitization workshops for the stakeholders (Farmers, Processors, middlemen, suppliers etc)
 - Capacity building, particularly on the use and handling of handsets and continuous registration of the farmers and
 - Increased monitoring and supervision of activities at redemption centers to minimize abuse
7. A National legislative support for enhanced and sustainable ATA programs is advocated and should be pursued.
 8. The problem of poor funding and ageing staff situation of the ADPs (extension service) is worsening. In order to ensure rapid agricultural transformation in the country, an urgent and innovative mechanism of funding Agricultural Extension Service and supportive research endeavors as well as a sensible reform of existing extension service are desirable.
 9. There is paucity of data on livestock and fisheries production across the nation. It is critical to initiate the conduct of livestock population census and nationwide fisheries production survey in order to generate dependable livestock and fisheries data for proper planning.
 10. After two years of implementation of ATA, it is considered not too early to set up specialist teams to conduct mid-term assessment of the program to document the process of implementation and its achievements in order to enable consolidation of the program and to guide future initiatives.

Bumper yam harvest expected from this high productivity farm
